Miscellaneous.

Book Making in America.

It is somewhat alarming to know that the number of houses now actually engaged in the publishing of books, not including periodicals, amounts to more than three hundred.—About three-fourths of these are engaged in Boston, New York, Philadelphia and Baltimore; the balance being divided between Cincinnati, Buffalo, Auburn, Albany, Louisville Chicago, St. Louis, and a few other places.—There are more than three thousand book sellers, who dispense the publications of these three hundred, beside six or seven thousand apothecaries, grocers and hardware dealers, who connect literature with drugs, molasses and nails.

The best printing in America is probably now done in Cambridge; the best cloth binding in Boston, and the best calf and morocco in New York and Philadelphia. In these two latter styles we are, as yet a long distance from Hoyday, the pride of London. His finish is supreme. There is nothing between it and perfection.

Books have multiplied to such an extent in our country that it now takes 750 paper mills with 2,000 engines in constant operation, to supply the printers, who work day and night endeavoring to keep their engagements with publishers. These tireless mills produced 270,000,000 lbs. of paper the past year, which immense supply has been sold for about $27,000,000. A pound and a quarter of rags are required for a pound of paper, and 400,000,000 pounds were therefore consumed in this way last year. The cost of manufacturing a twelve month's supply of paper for the United States, aside from labor and rags, is computed at $1,000,000.

Some idea of the stock required to launch a popular work may be gathered from the Messrs. Longman's ledger. These gentlemen report that when 25,000 copies of Mr. Macaulay's two recent volumes went flying abroad from Paternoster Row, no less than 5,000 reams of paper, 6 tons of pasteboard, and 7,000 yards of calico were swallowed up.

Most of the large publishing houses now stereotype everything they intend to print—The electrotyping process is largely employed, and an experiment is now being made in Boston, of which we shall hear more some future time, which, if successful, will decrease the expense of sterotyping about one third. We have lately heard that a machine is in use in New York for type-setting, and that the second volume of Mr. Irving's Life of Washington was prepared for the press by its aid.

Four hundred years ago, a single book of gossiping fiction was sold at the palace gate in the French capital for fifteen hundred dollars. The same amount of matter contained in this expensive volume, Mr. Harper now publishes for twenty-five cents. Costly books, however, are not yet out of fashion, for we are all glad to know that seventeen hundred subscribers have already been obtained for Prof. Agassiz's splendid new enterprise.

The Harper establishment, the largest of our publishing houses, covers half an acre of ground. If old Mr. Caxton, who printed the stories of the Trojan war so long ago, could follow the Ex-Mayor of New York, in one of his morning rounds in Franklin Square, he would be to say the least, a little surprised.—He would see in one room the floor loaded with the weight of 150 tons of presses. The electrotyping process would puzzle him somewhat; the drying and pressing process would startle him; the bustle would make his head ache; and the stock room would quite finish him. An edition of Harper's Monthly Magazine alone consists of 160,000 copies. Few persons have any idea how large a number this is as applied to the edition of a book. It is computed that if these magazines were to rain down, and one man should attempt to pick them up, like chips, it would take him a fortnight to pick up the copies of one single number, supposing him to pick up one every three seconds, and to work ten hours a day.

The rapidity, with which books are now manufactured is almost incredible. A complete copy of one of Bulwers novels, published across the water in three volumes, and reproduced here in one, was swept through the press in fifty hours, and offered for sale smoking hot in the streets. The fabulous edifice proposed by a Yankee from Vermont no longer seems an impossibility. "Build the establishment according to my plan," said he, "drive a sheep in at one end, and it shall immediately come out of the other, four quarters, sock, lamb, a fell, but a leather apron, and a Bible."

Almost any one book in every one hundred only is a success. When Campbell at a literary festival, toasted Bonaparte as the friend of literature because he once had a bookseller shot, he was a trifle too rough on the trade. It is impossible always for a publisher to decide rightly. All publishers are naturally shy of a new MSS. of poetry for instance, for they know by experience that the deadest of all books is a dead volume of verse. The sepulcher of deceased poetry in Mr. Burnham's church-yard of old books, in Cornhill, is the largest bin in his establishment.

Some of the best books which have afterwards had the largest sales, have been in manuscript the most widely rejected. The novel of "Jane Eyre," so much praised by Mr. Curtis this season, was turned away from the publishing doors of almost every respectable house in London, and was pulled by accident out of a publisher's iron safe, where it had begun to grow mouldy, by the daughter of the book-seller, who had himself forgotten it.—"Eothen" was carried by its author, Mr. Kinglake, to twenty different houses, till at last in a fit of despair, he gave the copyright away to an obscure bookseller, paying the expenses of publication out of his own pocket. Mr. Thackeray's "Vanity Fair" was rejected by Mr. Colburn, for whose magazine it was written, that astute gentleman complaining there was no interest in it. A New York publisher fought the writer of a new popular book from spring to autumn, and at length gave in from sheer inability to escape importunity longer. After it was sterotyped, and before it was printed, he offered every inducement to persuade a brother bookseller to take it off his hand but without success. In despair he at last published it himself, and the sale went up to $20,000 in one season.

The life of an extensive publisher is of necessity one of great labor, both of mind and body. He begins with the author and ends only with the purchaser. Between these two worthies there lies a world of detail known only to the "Trade." Success to the useful craft!—*Boston Transcript.*

The Geometry of the Human Form.

Man, says Banni, is found to be constructed on purely geometric laws, though the beauty of his body and the harmony of its parts are now forever we suppose, hidden by the labors of the tailor. A great miracle is a house that widens and widens without any reconstructure, and adapts itself to the fresh wants of every year—that widens and still preserves its relative proportions—that widens and preserves its original shape and form. Nature in the compositions of the human frame, has so ordained that the face, from the chin to the highest point of the forehead whence the hair begins, is a tenth part of the whole stature; the same proportion obtains in the hand measured from the wrist to the extremity of the middle finger. The head, from the chin to the top of the scalp, is an eighth. From the top of the chest to the highest point of the forehead is a seventh. From the nipples to the top of the scalp is a fourth of the whole stature. If the length of the face, from the chin to the roots of the hair, be divided into three equal parts, the first division determines the place of the nostrils; the second point where the eyebrows meet. The foot is the seventh part of the height of the entire frame, the cubit and the chest are a fourth. The other members have certain affinities which were always observed by the most celebrated ancient painters and sculptors, and we must look for them in those productions which have excited universal admiration. The navel is naturally the central point of the human body; for if a man should lie on his back with his arms and legs extended, the periphery of the circle which may be described about him, with the navel for its centre, would touch the extremities of his hands and feet. The same affinities obtain if we apply a square to the human figure; for, like the contiguous sides, the heighth from the feet to the top of the head is found to be the same as the distance from the extremity of one hand to the other, when the arms are extended. The standards, according to which all admeasurements are wont to be made, are likewise deduced from the members of the body; such as the digit, the palm, the foot, and the cubit; all of which are subdivided by the perfect number which the Greeks call Teleois.

Butter—Its Improper Use.—There is a conventional propriety in all the habits of life and domestic economy, and a general rule and understanding, even in the details of the material and period of each meal of the day, the result of long experience.

No housekeeper of any pretensions to consistency or gentility, would ever think of having roast goose, or boiled pot luck for breakfast, or tea, toast and preserves for dinner. Is it not a gross departure from propriety and good housekeeping, and pandering to a depraved taste, to put butter on the dinner table with fat, roast, or boiled meats, swimming in luscious gravies? Many persons unconsciously without thought of the impropriety—while eating the fattest kind of beef or pork—use butter on their bread, and that not sparingly, spread on as if with a plasterer's trowel. It is an absurdity that no thoughtful person will justify, and a habit that ought to be corrected. The English, who are thought to be high authority on the philosophy of feeding, have a saying that "Butter should never appear on the dinner table, and cheese at no other time," which I hold as an absolute law.

Hard to bert—Telegraph news.

Furniture.
