CLEAN OUT BREEDING SPOTS

This is the Best and Safest Way to Go After Mosquitoes and Flies

Fumigation as a means to exterminate hibernating mosquitoes and other insects is not favored by Professor H. A. Surface, State Economic Zoologist, Harrisburg, especially by boys or other inexperienced persons. Cleaning out the breeding places of such pests is much better. Doctor Surface's views are set forth in a letter which he wrote to the Doylestown Nature Club, which has joined hands with the Doylestown Boys' Brigade in an effort to get rid of such nuisance as the fly and mosquito. Doctor Surface says:

"Concerning fumigation to kill mosquitoes, this work is too dangerous to be intrusted to boys, unless they have some older skilled and practical person with them. By means of pyrethrum powder and other materials mixed together, the pests can be stupified, especially when such preparations are burned in the rooms they inhabit, but in most cases they will not be killed, and should be swept and thrown into a fire. There is but one material in which I have absolute confidence, and this is hydrocyanic acid gas. It is very deadly, as such a thing must be to produce the desired results. You must understand that one cannot safely handle materials strong enough to generate gas to kill insects without being in danger from them himself. Hydrocyanic acid gas will kill all insects, mice, rats, etc., in the house, and is especially good to clean out bed bugs. I have published directions for its use, and am willing to send them free to those who are interested, but it is a dangerous proceeding for a person who is not able to follow directions with care. It is not best to let the boys try it. I do not think it safe to fumigate a cellar, for example, and inhabit the room immediately above it at the same time. This gas rises instead of falls. Also, it is more difficult to ventilate cellars with safety.

"It is far better to treat the fly and mosquito nuisances by absolute cleanliness gas to pig pens, poultry houses, stables, etc., for destroying breeding places of the fly, and drainage and oil on pools, and other quiet waters, to destroy the breeding places of the mosquitos. Rain water barrels, old buckets, tin cans, etc., left on dump heaps or around the premises, and also unscreened cisterns, make breeding places enough to infest the entire neighborhood. Let the boys turn their attention to the breeding places of these pests. This will be much less expensive and dangerous than to attempt to destroy them in houses during winter."

FALMOUTH

The peach crop in this section will be a total failure this year.

Paul Sultzbach of Manayunk, Philadelphia, was in town for a few days.

Cyrus Strayer, of Harrisburg, visited his mother several days this week.

Professor and Mrs. I. Oliver Fry, of Bainbridge, spent yesterday here with friends.

Mrs. Annie Fishel and daughter, Miss Sarah were visiting at Middletown several days.

Misses Catherine and Merle Stipe, of Middletown, visited Mrs. Harry Carl several days this week.

Mr. and Mrs. George Walton spent a few days at Harrisburg with the parents of Mrs. Walton.

Mrs. Mary Horst has returned home after a visit with relatives and friends at Harrisburg and Steelton.

Jefferson Hemperley, who was critically ill for a few weeks is improving, and on a fair way to recovery.

A number of improvements will be made to the United Brethren church in the near future. A social will be given by the members of the congregation.

Mrs. Annie Fishel entertained the following at a dinner: Mrs. John Bruaw, of Bainbridge; Mrs. Jacob Mansberger and son of York; Lee Fishel, of First Lock and a few friends from this section.

A MERCILESS JUDGE

One Who Shows No Favor

A merciless judge is Father Time. Before him the weak and the wanting go to the wall. Only the truth can stand. For years the following statement from a Mount Joy resident has withstood this sternest of all tests.

Mrs. H. N. Nissly, Barbara & Mt. Joy Sts., Mt. Joy, Pa., says: "I had been suffering from a weak back and other kidney ailments for some time. I had a dull ache across my kidneys that made me sick all over and I was bothered by chills and dizzy spells. My kidneys were not doing their work properly. Doan's Kidney Pills were recommended to me as being a good remedy for these troubles and I began using them. A few doses benefited me and I continued until I was cured."

Confirmed Proof

On March 17, 1914, Mrs. Nissly said: "I still recommend Doan's Kidney Pills and confirm my former endorsement. I have had no occasion to use a kidney remedy since Doan's Kidney Pills cured me."

Price 50c, at all dealers. Don't simply ask for a kidney remedy—get Doan's Kidney Pills—the same that Mrs. Nissly had. Foster-Milburn Co., Props., Buffalo, N. Y.

HOW TO PRODUCE GOOD SEED IRISH POTATOES

Interesting Information Given Out by U. S. Department of Agriculture

Washington, D. C.—This is the season of the year when the farmer should pay particular attention to seed potatoes, cautions the department of agriculture, and the use of high grade seed would increase the returns from the potato crop of the country by many millions of dollars. A conservative estimate of the increase that might be expected from the use of high grade seed is certainly not less than 10 per cent. Such an increase based on the average production of the past five years would amount to over 34,000,000 bushels, having an approximate value of $21,000,000. Of the many causes which operate to produce a low average potato yield in this country, pure seed is an important one. The American potato grower pays too little attention to his seed potatoes.

The European growers, especially those of Great Britain and Germany, pay very strict attention to the quality and quantity of seed they use. This has led to the differentiation of the potato industry into seed and crop specialists. The seed specialist makes a business of producing high-quality seed, while the crop specialist produces a high-grade table potato. No such differentiation, at least to the same extent, occurs in this country. While it is true that in certain sections there is a well-developed seed potato growing industry but comparatively few growers in these sections are paying sufficient attention to the elimination of diseased and unproductive strains or to keeping the variety grown free from mixture with other varieties.

By far the simplest and most promising means of developing high-grade seed potatoes is that of the tuber-unit and hill-selection methods. The former consists in selecting from the seed bin before planting time a considerable number of the most perfectly shaped tubers of from 6 to 8 ounces in weight. When planted these tubers are quartered, as dropped, into 4 as nearly equal parts as possible. This is due by splitting the bud-eye cluster in each direction from seed to stem end of the tuber. The 4 pieces of each tuber are dropped consecutively in the row at a distance of from 10 to 12 inches apart in the furrow. All tubers showing discoloration of the flesh or other evidence of disease should be rejected.

By allowing an additional space between each set of fours, the four plants from each tuber are definitely isolated from adjoining ones, and the grower can readily observe any variation in vigor and uniformity between the units planted. This method also enables him to detect any mixtures that may occur in the variety.

At digging time the product of each unit is separately harvested, and a further selection made from marked units of all those which most nearly approach the size, shape and smoothness desired. The selected tubers should be numbered with both field and unit numbers and separately placed in small sacks. From each of the units retained 10 of the best tubers should be selected for the next season's planting. It is desirable to maintain the study of each selection on the tuber-unit basis the following season because it permits a more accurate comparison of the behavior of each.

The hill-selection method consists in marking the most promising plants during the growing season. At harvesting time save only those which give greatest promise. Keep the progeny of each hill separate, and take the same data as outlined for the tuber unit. Plant on the tuber-unit basis the following season. For sake of uniformity, a definite number of tubers—5 or more—should be planted from each hill selection. From this point on the methods given in the tuber-unit work should be followed.

The only requirements for the successful practice of the two methods of seed selections are a reasonable degree of painstaking effort on the part of the grower, some 12-inch garden labels, a small pair of balances, a sufficient number of suitable small sacks and a safe place in which to store the selected tubers until required by the next season's planting. In addition to this, the grower should have a breeding plant in which each season's selections can be developed up to the point of field-planting stock.

The selection of breeding plat need not necessarily be divorced from the general field plat. In most cases it can be more conveniently handled if it is a part of the regular field. All that is required is to set aside as many rows as may be required to plant the selected tubers. These should be preferably on one side of the field so that they can be more readily observed. The planting furrows may be open, and a fertilizer distributed with the potato planter by removing the disks and setting the plow a trifle deeper. If a plow is used in covering, care should be exercised to avoid displacing the seed pieces.

The visit of Secretary Bryan to South America this fall will no doubt convince the people down there that there are different kinds of wonderful people in this country.

Everybody makes mistakes, but only wise people profit by them.

6 Cylinder 48 H.

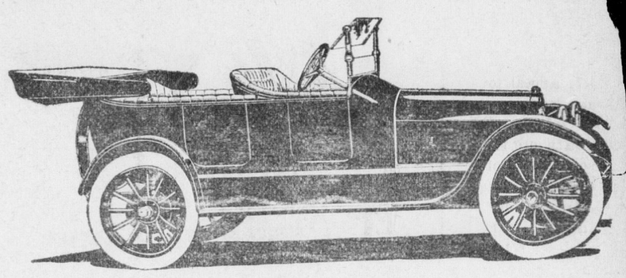
Herff-Brooks



The Material

The cost of automobile material is perhaps the most vital factor in the selling price. T ever, a marked difference between even the same parts.

Let us suppose for instance that you buy an "assembled" or "standardized" car.

That means that the motor car manufacturer, must buy those parts from the parts ma who most naturally adds a profit, not only on his raw material; but also on his labor cost, facture almost every part of the Herff-Brooks car.

Herff-Brooks parts are produced in our own plant which is one of the largest and best tomobile factories in the United States. Our organization consists of highly specialized mechan expert in his particular line of work.

Our motors are built by motor specialists; our transmissions by transmission specialist specialists on tools, gears, foundry work, body making and finishing work.

Each man is a specialist and yet each man is a pay-roll member of our organization. Th see that the workmanship is the very best that money can secure.

This alone gives the Herff-Brooks car an advantage over the car that is merely an ass different parts produced by as many different makers.

By manufacturing these parts we save the profit of the partsmaker.

That's saving No. 1

But our plant is so large and so well equipped that we manufacture parts for other builders throughout the country. These parts are manufactured at a profit. This profit is turn production of Herff-Brooks cars.

That's saving No. 2

Therefore, on material alone we have two distinct savings.

We save the partsmaker's profit, and we save the profit we make by selling to other companies.

LANDIS BROS
Rheems, Penna.

There was an earthquake shock in South Carolina the other day, but we fear it will take something more than that to cure the people of Bleaseism.

Senator Tillman having succeeded in getting the Senate to stop smoking while in executive session, who can now truthfully allege that Senatorial influence is declining?

Vice-President Marshall suggests as a remedy for the divorce evil that a husband kiss his wife every day. But suppose she is too busy pouting.
