#### All-Out Fight in Florida Controls Fruit Fly

One year ago on Nov. 26, 1958) field workers of the last fly was trapped in Nov-U. S. Department of Agriculture and the Florida State ember of that year, only 13 Plant Board trapped the last Mediterranean fruit fly in the flies were found. United States in Manatee County, Florida.

For these workers — and for the fruit and vegetable industries of the Southern United States - Nov. 26, 1957, will long be a landmark in man's continuing fight against insects. Since that date a comprehensive trapping program has been continued to make sure the Medfly has not survived in some isolated section of Florida, the only State in which it was found in 1956 and 1957. Not a single Medfly has been trapped.

Entomologists term the Medfly the world's worst fruit pest It also attacks many vegetables. During the period April 13, 1956, to Nov. 26, 1957, it not only menaced an mals and fish and wildlife Florida's \$400 m llion annual were effect vely protected. fruit and vegetable crops but During the month of July also those across the south- 1956, at the height of the ae-

ern half of the Nation. The Medfly invasion began entomologists believe, when the pest sneaked into Flor da in baggage arriving at a Miami area water port or airfield It was first discovered by a Miami home owner, infesting his backyard grapefruit trees. The pest was identified promptly and within ten days a full-scale attack was under way. State quarant nes were 'nvolked promptly and road blocks set up to pravent spread of infestation through move-

ment of products. Survey teams af trained inspectors searched out affected areas and measured the size and intensity of each infestation. These early surveys showed the Medfly to be infesting a thousand square-mile strip along the southeastern Florida coast. Accelerated surveys and trapping operations quickly revealed its presence on the Florida west coast and in central Florida - the main citrus producing area of the State.

By April 30, just 17 days after the pest was first reported the heaviest infestat ons were under spray treatment with ground equipment and on May 18 with small a rplanes By June 15 aerial spraying had begun over metropo'itan areas with multi-engined aircraft. At the height of the program scores of aircraft were used to lay down a bat spray newly developed by the Department's Agricultural Research Service scientists. The program was surrounded by appropriate safeguards so that man,

### Pa. Honey Crop Off; U. S. Up 9%

Pannsylvania honey production for 1958 is estimated at 3 432 000 lbs, or seven per cent below the five-year average It was six per cent below 1957, and 30 per cent below the ten year average.

Colonies numbered 143 000 in 195° ending a decreasing trend and up six per cent from 1907 Average vield per colony was 24 lbs. Value of the 1955 honey crep totaled \$872,000, with bee wax being valued at \$33,000 Average price for honey received by state brekeepers in 1958 was 254 c-as n lb, averaging more tha. \$6 per hive incoma

The Crop Ropo ing Service sta ed that U. S 1958 honer or duction totaled 26-5,629 00) lbs, an increase of sine per cen' over 1957 and 13 per cent above the five year average Production average from 2.42 million colonies was 49 lbs

The national price average was 174 cents per lb Production increases were 31 per cent in the West 22 per cent in the West-North Central, and 21 per cent in South-Central Decreases were 18 per cent in North-Atlantic, 15 per cent in East North-Central and 14 per cent in South Atlantic.

The 10 leading honey states which produced 61 per cent of the crop were California. Minnesota, Florida, Wisconsin, Texas, Idaho, Iowa New York, Michigan and S. Dakota.

Once before, in 1929, this dreaded fly invaded Florida. At that time it was eradicated by an intensive program w'thin a year's operation.

USDA-State cooperative efforts, including the destruction of many host plants and thousands of tons of infested fruit, were responsible for the quick success.

Such measures would not noon and an afternoon pro- asst. agent, and Mrs ave been feasible in 1956-57 gram of: Reports on National W Davis, Jr, Dilwork have been feasible in 1956-57 because of high labor costs and the large number and variety of ornamental and nat ve host plants growing in the Mami area which were not affected in 1929.

Furthermore, development of safe-to-use bait insecticide mixtures perm tted eradicated with a USDA research- tion without the destruct on developed attractant were in of millions of dollars worth operation to keep count of of ruits and vegetables that the dim nishing fly popula- accompanied the 1929 cam-

Modern - day eradication was achieved with modern-'ntensive trapp ng indicated day weapons — aerial applithe insect had been elimin-cations of bait sprays, soil ated from 21 of the 28 infestreatment under heavily inted count'es in southern and fested trees, plastic traps, atcentral Flor da Eradication tractants and various fumoperations had greatly redu-gants - many of them develced the number of flies in the oped by the Agricultural Research Service laboratories
