wintered on it

Pa. Livestock Value Up \$11-Million

HARRISBURG — Cattle and sheep numbers increased during 1958, but the hog and horse population in the Commonwealth dropped, the State Department of Agriculture reported today.
According to the annual livestock inventory by the Pennsylvania Crop Reporting Service, the total value of all livestock on farms January 1 was \$325 million, an increase of \$11 million from the previous year.
All cattle and calves on January 1 were estimated at 1,877,000 head compared with 1,858,000 head the year before and a 10-year average of 1,818,000 head. The value of cattle and calves was \$400 million, 27 per cent above a year earlier. About 82 per cent of these animals were milk cows.
Steer numbers declined three per cent from a year earlier and stand at 143,000.
Hogs and pigs on Pennsylvania farms declined for the third consecutive year to to-

tal 508,000 head. This was one per cent below a year earlier, 23 per cent below the 1948-57 average and the lowest of record going back to 1867.
Hogs exceeding six months old, excluding sows and gilts showed the greatest decline in numbers. Pigs under six months increased one per cent to 348,000 and sows and gilts increased five per cent to 69,000. Other hogs six mo. and over declined 10 per cent to 91,000.
Total value of hogs was 17 million dollars, up \$2 million from a year earlier.
The sheep and lamb inventory of 259,000 head was up two per cent or 5,000 head from last year and eight per cent above the 10-year average. Total inventory value was \$45 million compared a year earlier and less than to \$39 million a year ago.
The number of work animals on Pennsylvania farms, totaled 50,000 head on January 1. This was 2,000 below one-third the 153,000 on farms 10 years ago.

Announcing another milestone in better Potato Blight Control

DITHANE M-22

You as a grower and we as "your partner in crop protection" are always concerned with better, easier ways to control potato blights. We believe our development of DITHANE M-22 to be a long step in this direction—as important a step as when we introduced DITHANE D-14 fifteen years ago.

DITHANE M-22 (maneb) is the result of step-by-step laboratory work and field trials. This careful, patient work paid off handsomely last season. Data from commercial trials and from field tests by cooperating Experiment Stations confirmed our confidence in DITHANE M-22 as a superior potato blight fungicide. We want you to share this confidence with us. Detailed information on last season's extensive fieldwork will be sent to you and to your supplier during the coming months. Right now we can tell you this:

We believe two main reasons why DITHANE M-22 outperforms other fungicides are its "built-in" ability to resist weathering, and its higher toxicity to blight spores. One and one-half pounds of DITHANE M-22 applied at seven-day intervals proved significantly better than two quarts of DITHANE D-14. Our dosage recommendations will range from one to two pounds, depending on weather, disease conditions, and timing.

Soon you will be planning your potato spray program. Before you decide on materials you ought to consider new DITHANE M-22. Its superior blight control performance, its over-all economy, its ease of handling will please you, and the higher yields of No. 1's will more than offset the small extra cost of a DITHANE M-22 program.

From your partner in crop protection —new, improved DITHANE M-22 (maneb)

DITHANE is a trademark, Reg. U.S. Pat. Off. and in principal foreign countries.
