OLIVER MOUNTED PICKERS

for today's 100-150 bushel yields

Here's your best choice of two-row mounted corn pickers. Long, eager snapping rolls with spacing you can adjust from the tractor seat. New roller-type gathering chains cut upkeep costs... are twice as strong, last three times as long as pressed steel or pintle types.

Side and wagon elevators are bigger... handle your big ears and bumper crop yields. Long, live snapping roll points lift the down and leaning stalks... bring in more corn every year... in every field condition.

You get more safety in an Oliver Mounted, too. Safety clearing of the snapping rolls... safety clutches on all main assemblies... safety roominess on the platform. If you own an Oliver row-crop tractor, be sure you see the Oliver Mounted before you buy a picker.

Tomato Growers
(From page 1)

10. For this reason, the growers in the river community normally transplant large plants by shovel as soon as frost danger is past.

With a good, early variety, growers feel it may be possible to start the plants in "jiffy pots" which will cue down considerably on the transplanting time

With the labor problem lessened, perhaps more of the 200 acres of Wheeling soil in the area would be put back into the production of staked tomatoes

Henry Heisey, Washington Boro R1, says the present acreage is far too small to maintain the market. He feels there should be at least 80 acres in the specialty to keep buyers interested.

A few years ago, Heisey said, nearly 100 per cent of the staked crop was planted to Stokesdale, but Fusarian wilt knocked that variety out and many of the growers turned to other crops.

"There is about 200 acres of class one and two wheeling soil in the Washington Boro area that could produce tomatoes for the early market," Amos Funk said. "We need to push for a variety that will fit our needs so that some of this land can be returned to tomato production."

The group asked Dr. Creech if there might be a possibility of having parent stock of strains 167 and 159 released by the University for commercial seed production within the next year.

Creech said he needs data proving these two varieties superior to present commercial varieties before he can go before the New Varieties Release Committee at the university and recommend release of the new varieties. In plots this year Funk said his 167 plot returned \$1148 per acre for the first two pickings. This compares to the \$774 for Moreton, one of the popular commercial varieties in the test plots. Funk said number 122 yielded well for him, \$2803 for the same period, but it has not shown up well at other places. "I feel I would be selfish in asking for the release of that strain," Funk said.

Martin Heisey found that his 167 had 37 percent number one fruits and one of the heaviest yields per stalk of any of the strains he tried.

"If I could plant only one variety, I would put in a 167, but if I could add another, I would like to have 159 to hit the earlier market," Heisey said.

Creech and other plant breeders are continuing research with these and other varieties with the hope that the Pa. 103 variety released a few years ago may be improved still further.
