

● Now Is The Time

(Continued from Page 4)

all wild garlic; during mid to late March the growth of these onions will reach 6 to 8 inches and in this stage they should be sprayed with the ester form of 2,4-D at the rate of 3 pints per acre; this heavy dose of the material during March should cause little damage to any other crop and after a few years, the stand should be eliminated. Don't expect one spraying to give complete control

Everything in the world is good for something — John Dryden.

**YFA Meeting Is Rescheduled**

The Southeastern Regional meeting of the Pennsylvania Young Farmers Association, originally scheduled for March 6 has been rescheduled for March 20.

The meeting, planned to be held in the Solanco High School, but postponed because of the snow storm and closing of the school, will be held in the same place.

The program will be essentially the same as originally planned with most of the scheduled speakers participating, according to William M. Fredd, advisor of the Solanco Young Farmers Chapter

**Tractors Top Sale At Noll Auction**

By C. A. DEAN, M.D.

**MEDITORIAL:** A reader writes that her son has staphylococcus of the nose, and she would like to know more about this infection. How is it contracted? Is it contagious? Can it be cured?

The staphylococcus is one of our most common bacteria. It is found everywhere—in the air, on our skin, etc. There are several types of staphylococcus germs, some more virulent (able to produce infection) than others. The non virulent (mild) type is the one responsible for pimples and small boils. The more virulent types result in repeated (infectious) boils, pneumonia and blood poisoning.

In recent years it came to light that our hospitals were having problems with staphylococcus infections. Unfortunately most of our antibiotics do not have an effect on this germ, so it is able to spread easily even where antibiotics are used in great amount. With antiseptic techniques, however, the threat of staphylococcus infections in hospitals has greatly diminished.

As for staphylococcus infections of the nose, the upper lip, nose and surrounding flesh form an unusually serious area for infections. The reason for this is that there are no nearby lymph nodes (as there are everywhere else in the body) for the infection to spread to and be trapped, and the only place the infection can spread is deep into the head. Prompt, special treatment is needed to prevent such a complication. This type of infection is not contagious, it is usually cured with adequate treatment.

Infections of the nose most commonly result from pulling a hair out from inside the nose. All such hairs should be cut and never yanked out by their roots.
