USDA Announces Milk Indemnity Program

The U. S. Department of Agriculture recently announced an indemnity payment program for dairy farmers whose milk has been removed from the market because of pesticide residue.

The program will carry out Sec. 331 of the Economic Opportunity Act of 1964. This Act authorizes the Secretary of Agriculture to make indemnity payments at fair market value to dairy farmers who have been directed since Jan. 1, 1964, to remove their milk from commercial markets because it contained residues of chemicals registered and approved for use by the Federal Government at the time of their use Congress recently appropriated funds for this purpose.

Regulations containing terms and conditions of the payments will be filed with the Federal Register in a few days. Farmers may apply for payments at county Agricultural Stabilization and Conservation Service (ASCS) offices. They may obtain copies of the regulations and application forms there in a few days.

A farmer is eligible for indemnity payment if his milk has been removed from the commercial market because of detection of pesticide in the milk by tests made by a public agency, or under a milk testing program recognized by a public agency as adequate for the purpose. He is eligible for payment on milk kept off the market by this action from Jan. 1, 1964, until he is reinstated and again is permitted to put his milk on the market or until Jan. 15, 1965, whichever is earlier. Payment authorization expires Jan. 31, 1965.

The amount of indemnity payment to an eligible farm-

er will be based on the quantity of milk he normally would have marketed and the price he would have received during the period his milk was kept off the market. For this purpose the quantity he would have marketed will be considered as his "normal marketings." This will be the quantity he marketed a year earlier, subject to appropriate adjustments in his rate of marketings to reflect changes in herd size or other conditions.

The "fair market value" will be the price the farmer would have received for milk during the period, less transportation and other marketing charges he normally would have incurred. The price he would have received during this period will be that received by other farmers in the same area from the same handler.

As a condition of indemnity payment, a farmer must certify that if he used a pesticide

he followed the directions on the label. Also, he must certify the time the pesticide was used. Additionally, he must certify that he did not knowingly purchase contaminated feed for his cows.

The three chemicals which have caused milk to be cut off in the cases reported so far are heptachlor, dieldrin and DDT. Other pesticides may be involved.

A farmer may apply immediately for indemnity payment on milk which has been kept off the market and then file additional applications covering approximate monthly periods, until he is reinstated or payment authorization expires.

The booklet "Interior Decoration for Veterans Administration Hospitals," can be obtained at the Government Printing Office, Washington, D.

C, for 40¢ a copy.

Nine out of ten cows make more milk on Agway's profit feeding plan

Over the last four years 397,078 cows have been managed according to Agway's PFP. Available DHIA records show that nine of every ten PFP herds responded with more milk... some with increases in income over feeds costs of as much as \$62 per cow per year.

Try PFP this year. There is no equipment to buy, not even any drastic changes in your work procedures needed. PFP is simply ten progressive dairy herd management practices... to help you raise your herd's production, and your profits. Ask at Agway about PFP today. You can begin right now to put your herd in the high production class.
