Aluminum Foil In The Oven

Aluminum foil has many uses. But one way not to use it is to line the oven with foil. When you line the bottom of the oven with foil, you are re-

designing it so the heat may not circulate properly.

The way to use aluminum foil to catch the runover from a pie in the oven is to wait until the pie has been in the oven for a while and the pie looks like it's about to bubble over. This is the time to put a piece of foil only slightly larger than the pie pan in the oven. Turn

up the edges of the foil, making a dish which will hold the spillover. Place the foil on an oven rack directly under the pan. Don't use a piece of foil any larger than you need it and never cover the entire rack with foil.

Lancaster Farming, Saturday, March 18, 1967—17

● Key Milk State

(Continued from Page 20) of milk production dropped 59 quarts.

Other States Affected

Similar trends were noted in neighboring Ohio and New Jersey.

In Ohio, eighth ranking milk producing state in the nation, the annual per capita production rate dropped by 74 quarts per person between 1950 and 1965... from 309 to 235 quarts. In the same 15-year period, New Jersey suffered a loss of 37 quarts in its per capita milk production rate... from 110 to 73 quarts.

How much longer these trends will continue is becoming a matter of concern. Latest reports disclose a sharp drop in 1966 milk production in the nation—1.8 billion quarts less than the amount produced in 1965. On a per capita basis, the loss amounted to about nine quarts less milk per person.

● Bull To Attend

(Continued from Page 13)

the crops elected, estimated crop losses, and measures being taken to reduce losses.

"This is a problem that requires extensive study, not only to curb crop losses, but also to protect desirable species of birds," Secretary Bull said. The primary problem, however, is to safeguard food production to meet the needs of an expanded population, he explained.

Get the BIG silo unloader value!

VanDale

Delivers more silage faster!

Double auger system digs the silage faster and more evenly under all conditions whether silage is frozen, wet, or dry.

Exclusive, adjustable drive hub gives more positive traction, keeps the machine operating evenly, and requires less power.

DELIVERS BETTER SILAGE TOO!

The double augers, operating in conjunction with the patented V-paddle impellers, dig the silage, mix it thoroughly, and then throw it down the chute. Your cows and cattle get good, palatable silage... not a powdered mash as so often happens with unloaders using blowers.
