

"I Made A Mistake When I Purchased A Concrete Stave Silo"

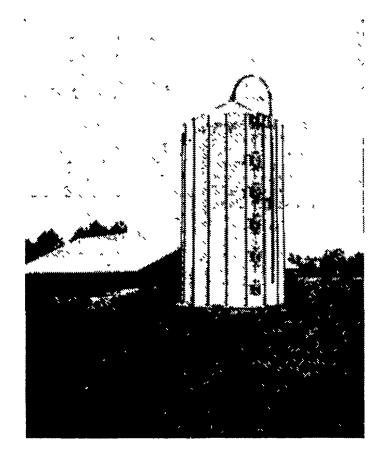

These are the words of Franklin Smith of Coolidge, Georgia. Smith purchased a 600-ton Butler Stor-N-Feed structure in August, 1965... his first experience with a vertical silo.

He didn't have enough total silage storage capacit; and since he preterred this method of feeding and liked the feed that came out of the structure, Smith decided to purchase more storage 1, 1966.

He purchased a 20'x60' 520-ton concrete stave silo because of the lower price. Now Smith says, "I made a mistake."

He comments, "My Butler structure will hold nearly twice as much silage as the concrete stave... I lose 10' in the top of the concrete silo because of the distribution and the settling... I can never get it full... I have to refill several times because of the poor packing and settling. The Butler structure costs very little more on an actual cost-per-ton of storage... I don't like the labor problem of climbing up the chute on the concrete silo to adjust the unloader to another silo door... the unloading rate is much slower than my Butler."

And, most importantly, Smith says, "I have severe spoilage in my concrete stave .: . there is no spoilage in my Butler structure."

A film, "Farm Tractor Safety

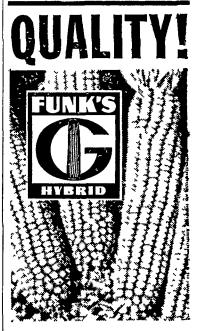

— A Family Affair" was shown.

The next meeting will be held
at Kauffman Bros, Mountville
on February 6 at 7 30 pm.

Small Grains Are Valuable For Pasture

Small grains as pasture can profitably be used for livestock to extend the grazing season in the fall and early spring when regular pastures do not make much growth, Tioga County's agricultural agent told members of the Pennsylvania Crop Improvement Association at their meeting during the 52nd Farm Show last week.

"Dairy and Investock production as more profitable when cows have plenty of good pasture for a longer period of time," Larue K Thomas said. "Supplementary forages consisting of small grains can be very useful an supplying this added pasture"
