## Tips from a Pro

**LOOK BEFORE YOU BACK!**

## Less Wrinkling Is Result Of Tumble Drying

Heat-controlled tumble drying is ideal for durable-press fabrics. However, clothing or household linens of durable-press fabrics can be line-dried but usually will need some touch-up pressing, says Mrs. Ruth Ann Wilson, extension clothing specialist of The Pennsylvania State University.

Durable-press fabrics contain man-made fibers which are softened by heat or cotton fibers treated to perform in a similar way. To get a permanent shape or crease, the garments are processed with heat and pressure. This sets the fibers and they return to their original shape time and again after laundering.

Tumbling in a heat-controlled automatic dryer heat-softens the fibers, relaxes the wrinkles formed by wearing, and lets the garment return to its original shape and creases, according to Mrs. Wilson.

Drying in small loads, about half the dryer capacity, and removing articles as soon as the dryer stops, will result in less wrinkling. Whenever touch-up

## PENB Follows Up With Right Answers

When the Poultry and Egg National Board sees inaccurate statements about eggs in print, it doesn't get all cracked up about it. Instead it follows through back to the source, supplying the correct information.

PENB's corrections are generally well received, reports Dr. L. A. Wilhelm, president, and the publications usually print them. That way the consumer is the real winner.

Recently, for instance, "To Your Good Health," a syndicated medical column by Dr. George C. Thosteson, appearing in newspapers across the nation, contained a question about blood in egg yolks. In his answer, the doctor stated that blood in a yolk means that the egg has been fertilized, a popular misconception.

In a non-critical, informative pressing is needed, use the non at the low setting, advises Mrs. Wilson.

letter to Dr. Thosteson, Dr. Wilhelm pointed out that blood in the yolk normally does not mean that an egg has been fertilized, that it is a natural occurrence in about 2 percent of all eggs, and that the egg industry does a highly creditable job in removing these eggs from the market.

Dr. Wilhelm also noted that the chances of a consumer buying fertile eggs is infinitesimally slight, since less than 1/10 of 1 percent of the 285 million hens producing table eggs are mated to roosters.

In a letter thanking Dr. Wilhelm for his "pleasant and rational account of the matter," Dr. Thosteson indicated that corrected copy has been rushed to the syndicate and an article quoting Dr. Wilhelm will be appearing in the column in the near future.

## Farm Records Session Set For Martindale

The fourth in a series of farmer education meetings is scheduled for 7:30 Wednesday evening, February 5th at the Lincoln Independent School building near Martindale. The session is part of a series of seven of the Eastern Lancaster County Adult Farmer program.

Robert Herr, chairman of the Agriculture Department of the Eastern Lancaster County School District, will conduct a workshop on farm record keeping for tax purpose and introduce the Pennsylvania Farm Account Book as a means of keeping records for today's farming operation. Included in the discussion will be changes in the tax laws affecting the farmer and how good records can help meet these changes.

The three preceding meetings have proved to be popular with area farmers as an average nightly attendance of 47 turned out to hear various speakers at each of the meetings sponsored by the Eastern Lancaster County Adult Farmer Program.
