Introducing . . . THE B-305

- Q: What other data do you have from your field tests on the B-305?
- A: Field test performance and Random Sample Test data confirms similar performance between the B-300 and the B-305. The most important difference between the B-305 and the B-300 is increased Marek's resistance in the B-305. We doubt if most producers will be able to measure any significant differences in the various production characteristics.

RAISING PULLETS on YOUR FARM? WE RECOMMEND MUSSER'S M-327 CHICKS

The breed of 2 separate lines of Musser Leghorns, which when crossed, produced the sturdy M-327 Leghorn chick that you have been hoping for.

Why?

Because Musser's M-327 Chicks have

1. Coccidiosis under control to the extent that you seldom have a minor outbreak of Coccidiosis
2. A consistent low level mortality rate, while contending with the highly publicized leukosis (Marek's) disease
3. The mortality and the rate of lay so satisfactory that you can be assured of a yearling capable of showing a profitable second year
