**Descending Animals**

The idea of making pets out of wild animals is to be discouraged. We have mentioned this fact previously but a recent plea by our Dr. Sam Guss, Penn State Veterinarian, suggests that local veterinarians refuse to descent skunks because they are a serious public health risk. Skunks are considered one of the

most important feral vectors of rabies, and they can excrete tremendous amounts of rabies virus in their saliva without showing symptoms. The descending of animals in some states becomes a professional ethical problem and in Pennsylvania the practice is to be

discouraged. Parents are warned about exposing their children to these kind of pets. Why pick on a skunk, anyway? There are many other types of pets more attractive and much safer.

## NEW JOLT™

soil insecticide  
de-fuses resistant  
corn rootworm  
population bomb

**By June, it's too late if you count 10 worms per plant, because 8 to 10 per plant cause serious damage. Where corn follows corn, resistant rootworm buildup may reach a count of 120 worms per plant!**

Now you can easily stop this infestation as larvae hatch. One application of new Jolt granules at time of planting controls rootworms resistant to other chemicals, as well as non-resistant rootworms, throughout the growing season.

Free-flowing Jolt granules are easy to apply. At the rate of 5 to 7 pounds per acre in a 7-inch band over the row, Jolt mixes with the top half inch of soil. Do not apply Jolt in the seed furrow.

Jolt moves with moisture through the soil, kills on contact. It leaves no harmful residue, can be used on any corn including silage.

Cost? About \$2.50 to \$3.50 an acre. So no need for

high resistant-rootworm populations to exist.

Check application details with your dealer. Ask how Jolt controls all rootworms, can eliminate significant damage to your crop, help you get top production.

*Jolt granules contain prophos, an organo-phosphate, and should be handled with care. Follow directions on label.*
