

What's New?

A new, ingenious, collapsible reservoir which converts an ordinary farm wagon, truck body or pick-up truck to a portable water reservoir has been announced by Burch Manufacturing Company, Inc. of Fort Dodge, Iowa.

Called Kolaps-A-Tank Reservoir, it is perfect to use wherever water needs to be hauled - such as to livestock or poultry, for spraying operations, for washing down equipment, for usage on construction jobs - or a hundred and one other uses.

The Burch Kolaps-A-Tank Reservoir is fabricated of tough, rugged, heavyduty coated nylon - and according to Karl Burch, sales manager of the company, will withstand the most severe outdoor exposure. When not being used, it rolls up into a compact unit for easy storing.

According to Burch, the Kolaps-A-Tank Reservoir not only provides a handy, economical way to haul water anywhere it is needed, but it is exceptionally easy to use. To fill the Kolaps-A-Tank Reservoir, the operator simply spreads it out flat on the floor of the wagon box, truck body, or pick-up truck and fills it with water through a 10-inch spout on top. It is quickly emptied through a 3-inch spout on the bottom.

Kolaps-A-Tank Reservoir is available in several sizes to fit standard wagon boxes, truck beds and pick-up trucks - in

capacities from 525 gallons to 1,340 gallons.

Further details on Kolaps-A-Tank Reservoirs are available by writing for Bulletin KT-72 to Burch Manufacturing Company, Inc., 618 First Ave., Fort Dodge, Iowa 50501.

The Big Blondes Have Arrived!
Semen from Blonde d'Aquitaine bulls processed in the French mini-straw has been released from the USDA quarantine to Blonde d'Aquitaine Breeders of America for distribution to American cattle breeders. Blonde d'Aquitaine Breeders of America is a venture headed and managed by interoceanic cattle company with headquarters at Stillwater, Minnesota. Advance orders for semen are now being processed by this organization.

The Blonde d'Aquitaine is France's most tested beef breed.

The semen importation just released from USDA quarantine is represented by 12 Blonde d'Aquitaine bulls from the three primary strains of Blonde d'Aquitaine cattle in France. A limited amount of semen is available from this exceptional group of bulls which were selected by the Society of French Blonde d'Aquitaine Breeders from among many hundreds of prospects. These bulls were selected as calves and were

retained on the farms of origin without foot and mouth vaccination by special permission of the French Veterinary Authorities. The bulls were then held for over a year prior to their health tests and final selection for entry into a special quarantine facility constructed in Brittany inside an abandoned naval base. The French Admiralty, French A-I Centers, the French Maritime

Service (who supplied the fresh feed that was brought in from Ireland) and the United States Department of Agriculture cooperated in the project which is regarded as being a model of international cooperation in livestock production.

Because of this cooperation American breeders will have at least a four to five year lead over the new United States quarantine

station to be built on the Florida Keys. Plans are also underway for the formation of the Blonde d'Aquitaine Herdbook of America which will include Open A-I and Registration of a complete grading-up program.

TRY A CLASSIFIED AD-IT PAYS!

Certainly Lasso[®] controls 'new' grasses like fall panicum in corn.

—Solves 'old' weed problems, too. In both corn and soybeans.

Plenty of growers last season learned that the "foxtail" they thought grew through their herbicides was really fall panicum.

And plenty of growers this season will learn that if you apply Lasso, you won't find fall panicum. Nor will you find giant foxtail, crabgrass and most other grasses. Works on broadleaves like pigweed, too.

In short, Lasso solves plenty of weed problems — Or keeps them from becoming problems.

That's what you expect from your herbicide.
