

Weed Scientists Study Crop-Herbicide Rotation

Crop rotation practices have been used for centuries. One of the reasons for using crop rotations is to control weeds. The widespread use of herbicides as well as other pesticides has affected the use of rotation sequences and has also affected the types of weeds found in many fields.

Drs. Clyde C. Dowler, E. W. Hauser and A. W. Johnson, USDA research personnel at the Georgia Coastal Plain Experimental Station, Tifton, Georgia, reported some results of a 4-year crop-herbicide rotation study at the 1973 Weed Science Society of America meetings in Atlanta, Georgia.

Corn, cotton, peanuts, and soybeans, grown continuously or in rotation, were treated with either cultural or herbicide weed control programs designed to control a broad spectrum of weeds. Herbicides controlled more weeds than cultural practices in all cropping sequences.

Weeds were almost entirely eliminated in five of the eight herbicide cropping sequences in each of the last 3 years of the

study. Several rotations drastically reduced the number of weeds but the ecological content of the initial major weed species (crabgrass, Florida pusley, Florida beggarweed, cocklebur, sicklepod) was not altered.

Under 4 years of cultural weed control practices, the cropping sequence and climatic factors influenced the amount of weeds at harvest time. For example, more weeds were present at

harvest time in corn grown continuously than in a cropping sequence of peanuts, cotton, soybean, then corn

Saddle Cinches Tour New Bolton Center

The Saddle Cinches 4-H Horse and Pony Club took a bus trip to the New Bolton Center School of Veterinary Medicine March 10th.

There were 14 Club members: Sue Cassel, Gavle Shultz, Sharon Nissely, Margaret Keeney, Robert Keeney, Liza Kauffman, Debbie Myers, Kim Bernhardt, Jerry Bernhardt, Patsy Steffy, Barb Steffy, Regina Kasara, Barb Helm, Penny Fulmer, one leader, Mrs. Tyrus Keeney, two parents, Mr. Nissely and Mr. Keeney and four guests, who went on the trip.

The tour of the Center lasted about one hour. Some of the highlights of the tour were witnessing of an emergency Caesarian cow operation, other operating rooms, the padded recovery room, the radiology room, the heart station, and all kinds of equipment used in the different rooms.

The horse stables were visited where the group saw a horse with his leg in a cast and feeding a horse intravenously. In the cow barn there was a donor cow used as a donor of poisonous bacteria found in the cow's third stomach.

The library was also toured.
