Fix-It Tip

Outdoor living means outdoor lighting. Lights at eye level cause glare so they should be placed 10 to 20 feet off the ground. So that large areas will be lighted, use floodlamps or bulbs in flood reflectors.

Use weatherproof sockets and floodlamps with weather-resistant glass. While you may think in terms of posts for overhead lights, don't forget they may be mounted on the sides of buildings and in trees.

If you lack an outdoor outlet, have an electrician install a separately fused circuit especially for your outdoor needs. Cable is then run from this in metal conduit to a waterproof metal splice box. Wiring may be run from here to the places where you want your lights.

Labeling and Packaging Requirements Updated

The U.S. Department of Agriculture (USDA) has standardized requirements for labeling and packaging vaccines and other biologics sold for use in animals.

Officials of USDA's Animal and Plant Health Inspection Service (APHIS) said that--except for a few new labeling requirements--the change merely incorporates into the Code of Federal Regulations existing administrative memorandums, notices, and policies affecting manufacturers licensed under the Virus-Serum-Toxin Act of 1913.

APHIS had proposed the change in December 1972. Comments were received from 15 persons during the 60 days set aside for this purpose. Most of the suggested changes were adopted in the final version, including provisions for extending the number of species for which a rabies vaccine may be used if the efficacy and dosage level are

properly substantiated.

In packaging and labeling their products--under the new regulations--foreign and domestic manufacturers will be required to:

-- Comply with labeling requirements for products imported for research and evaluation in the United States.

-- Follow new labeling requirements for modified live virus rabies vaccines. (Inactivated rabies vaccines already are subject to similar labeling requirements.) Labels have to carry warnings limiting vaccination to designated species of animals; establish dosages; and

recommend vaccination schedules. Manufacturers must substantiate efficacy of their vaccines for all animals listed on the label. Previously, this data was required for only six species: dogs, cats, cattle, horses, sheep, and goats.

At the same time, however, the new regulations relax labeling and packaging requirements for exported products, subject to restrictions against reimportation. Basically, APHIS now will allow export shipments in sealed shipping boxes marked as to contents without inclusion of individual package labels.

The amended regulations were published in the Federal Register

May 10. They will become effective June 11--except for those involving the labeling of rabies vaccines. To allow manufacturers time to print these new labels, they will have until November 6, 1973, to comply.

Care Key To Food Poisoning Prevention

Exposure of some foods to summer temperatures could lead to food poisoning and dangerous consequences, reminds Ruth J. Buck, Extension nutrition specialist at The Pennsylvania State University. Although cream pies, custards and potato salads are frequently food poisoning culprits, anything made partly or wholly of milk products, eggs, meat, poultry, fish and shellfish harbors bacteria that will grow at alarming rates in hot weather.

By maintaining the temperature of your refrigerator at 45 degrees F. and the freezer compartment at 0 degree F. or lower, you can be reasonably sure of food storage for three or four days. Leave space between containers to assure air circulation.

Refrigerate all perishables as soon as you get them home. Leftovers of large quantities should be divided into smaller containers and refrigerated as soon as possible.

After handling raw meat or poultry, wash your hands and any kitchen utensils you used. Never bring raw meat in contact with foods which will be eaten raw or only slightly cooked, since only high cooking temperatures will kill bacteria.

Your refrigerator will cool foods more efficiently if it is kept clean both inside and out. Keep the drip pan free from lint and dirt. Allow no more than a quarter-inch of ice to accumulate on the cooling coils. Check the latch and gaskets for a snug fit.

Perfumes, Colognes and Toilet Water

Your favorite scents are fashion accessories to be enjoyed every day. Mrs. Ruth Ann Wilson, Extension clothing specialist at The Pennsylvania State University, says perfumes can evaporate or spoil from exposure to cold or heat, so you may be disappointed if you save your perfume only for special occasions.
