MILK PRICE VS. WAGES

If food prices had kept pace with wage increases, what would a quart of milk cost you at the store? Average hourly wages in industry have increased from \$1.52 per hour in 1952 to \$3.65 in 1972. If food prices had increased at the same rate (2.4 times their 1952 level) your food bill would be much higher.

Clean Milking Equipment Twice Daily

Milking equipment on dairy farms is washed after each use just like the dishes from which we eat. Milking is done twice a day, so cleaning follows immediately after, says county agent Sidney E. Barnard, Extension dairy specialist at The Pennsylvania State University

Years ago milking equipment was rinsed in clear water after night milking and washed after morning milking. In those days milk was delivered to the consumer the same day it was produced. Today milk must keep at least seven to 10 days from production to consumption. This mandates the utmost in sanitation.

All milking equipment should be rinsed in lukewarm water following use. Cleaning is done with an alkaline cleaner and brush or circulated with a pump Proper strength and temperatures above 110 degrees F are keys to success. Rinse with clear water or an acidified rinse, if the water is hard.

Milking equipment must be free of bacteria, so milk will have good keeping quality says Barnard. Dairy farmers must go one step beyond what most housewives use for dishwashing. All surfaces are flushed with a solution of chlorine or iodine sanitizer. Hot water can't be used because temperatures of 170 degrees F are necessary to sterlize equipment surfaces.

Dairy farmers follow twice-aday cleaning and sanitizing practices for their milking equipment The purpose is to assure consumers of good quality fluid milk products, adds Barnard
