## 18-Lancaster Farming, Saturday, June 23, 1973

A Registered Holstein cow owned by Samuel I. Esh, Gordonville RD1, completed the highest 305 lactation. Cora produced 21,952 pounds of milk, 877 pounds of butterfat with a 4.0 percent test. Second high lactation was completed by a Registered Holstein cow owned by Nathan E. Stoltzfus, Gap RD2. Geraldine produced 18,863 pounds of milk, 854 pounds of butterfat with a 4.5 percent test in 305 days.

The herd of Rufus G. Martin, Ephrata RD3, had the highest daily butterfat average. This herd of 25.1 Registered Holstein cows averaged 65.2 pounds of milk, 2.32 pounds of butterfat with a 3.6 percent test. The herd of Allan R. Shoemaker, Kirkwood RD1, placed second. This herd of 42.8 Registered and Grade Holstein cows averaged 54.1 pounds of milk, 2.05 pounds of butterfat with a 3.8 percent test.

First 305 Days of Lactation with 600 or More Pounds of Butterfat.

Facts for Dairymen by N. Alan Bair, Assistant County Agricultural Agent

**High Production and Profit** For the past six months it has been difficult to talk to a dairyman or a group of dairymen for more than five minutes without the high cost of feed being mentioned. The statement is often made: "I can't afford to feed my cows to milk at top production." Oh yeah - better take another look.

The real question is: "Is high production profitable?" In these days of high feed prices, I'm sure many dairymen have asked this question many times as they feed old Bessie. To help you get some answers to this question, let's look at last year's D.H.I.A. records.

By grouping Pennsylvania herds according to level of production, we find 629 herds averaging 9,683 pounds of milk per cow, 2,531 herds averaging 13,155 pounds of milk and 564 herds with production above the 16,000 pound level.

We all know that it requires a certain amount of feed to maintain body weight and carry on regular body processes such as growth and reproduction. Although increases in production call for more feed, the additional amount required, as measured by feed cost, does not double if production doubles.

The feed cost for the lower producing group was \$278 per cow. The group averaging 13,000 pounds per cow was 35 percent higher but the feed cost only went up 19 percent. The high group with 16,000 pounds was up an additional 22 percent in production with only an 11 percent increase in feed cost.

It is well established that feed cost is one half the total cost of production. As production increases, income above feed cost increases and profits go up too. The profit for the 9,600 pound cow is \$107 compared to \$297 for the 16,000 pound cow. We must recognize that feed prices are higher and the margin between feed cost and milk price is narrower. These figures do point to the fact that it still is profitable to keep good cows and manage them for top production.

Feeding Sour Colostrum

Sour or fermented colostrum as calf feed has caught the interest of many dairymen in the county. Gallons of fresh colostrum that once was dumped in the gutter are now being poured into a 20 to 30 gallon plastic garbage can to sour. It appears to be a great food, calves like it, but how to properly store and feed it has prompted many questions. Don Ace, Extension Dairy Specialist at Penn State, reports that research on composite samples of colostrum milk show total solids about 1-1-3 times that of normal milk. Fat and protein are about two times higher and levels of iron, copper, cobalt, calcium, magnesium, sodium, phosphorus and vitamin A are elevated. One pound of colostrum milk may be considered equal to one and one-third pounds of normal whole milk. The following points, according to research reports from Scotland and South Africa, plus local observation, would appear to be valid recommendations if dairymen want to try fermenting and feeding surplus colostrum.

1. Store milk in a plastic container or any type container that will not corrode.

2. Allow colostrum to sour (ferment) naturally.

3. Colostrum from several cows (Continued On Page 19)
