**Sex Attractants Used
To Fight Fruit Pests**

"Cherchez la femme" or "find the woman," long a slogan of spy and detective stories, has acquired new meaning in the fight against insects attacking fruit orchards.

Using synthetic chemicals identical to or closely related to chemicals emitted by female moths, entomologists of The Pennsylvania State University are luring male moths to traps coated with a sticky substance.

The principle is being used this summer at the Fruit Research Laboratory of The Pennsylvania State University at Biglerville. Adams County Entomologists Dean Asquith and William M. Bode are trapping hundreds of male moths of several species.

The process is relatively simple "Micro" or tiny amounts of sex attractant chemicals are injected into containers called wicks, often fashioned from plastic bottle caps or rubber septa enclosures used to seal serum vials. Placed in traps, the wicks release the attractant into the air for as long as 6 to 8 weeks.

The long period of potency makes the sex traps a useful way to monitor orchard populations of many pests-- among them the codling moth, redbanded leafroller, tufted apple budmoth, obliquebanded leafroller, and Oriental fruit moth.

Much was known about the flight habits of certain apple pests before the discovery of the sex attractant process. Asquith and Bode point out However, other trapping and detection methods are relatively difficult and time consuming.

Trapping male moths as they follow the sex attractants tells entomologists when a particular pest first appears in the growing season, when it reaches its peak population, and when it is no longer a problem. Answers to these questions help University researchers decide if and when pesticides are needed, and how much should be used.

The Penn State entomologists say there is no period during the growing season when Pennsylvania apple orchards are free from attack by insects.

In southern Pennsylvania, for example, three generations of redbanded leafroller moths fly each season. The first moths appear in mid-April and the last ones aren't gone until late in September. A gap between flights of first and second generation redbanded leafroller moths in late May and early June is filled by tufted apple budmoths, which first appear in early May and are present until early October. Two generations of this pest threaten apple orchards each year, with no distinct break between generations.

The flights of second and third generation redbanded leafroller moths also have a tendency to overlap. Moths of the obliquebanded leafroller take to the air in early June and continue flying until September. Fortunately, this insect is not numerous as one larva can chew a whole side off an apple.

Studies of insect sex attractants, and a host of other projects at the Fruit Research Laboratory, are carried out within the Agricultural Experiment Station at Penn State. Hopefully, researchers will devise techniques combining spraying and biological methods to control orchard pests and still keep insecticides within reasonable levels. The sex attractant study is sponsored by the National Science Foundation.

Farmers received an increase of just 12 percent on the products they sold over the last 20 years. In fact, farm prices either declined or remained unchanged during 10 of the last 20 years.

**PUBLIC AUCTION
SURPLUS INVENTORY OF
FARM SUPPLIES, TOOLS, EQUIPMENT
& TRUCKS
TUESDAY, JULY 31, 10:00 A.M.**

At Agway, Inc., 101 Main St., Salunga, Pa.

**MILKING HERD and
BRED HEIFER DISPERSAL**

WEDNESDAY JULY 25, 1973

12:00 P.M.

Located on the farm at RD2 Palmyra, along Rt. 341 in Upper Lawn, South Londenderry Township, Lebanon County. Appx. 4 miles south of Campbelltown off Rt. 322.

**78 HEAD 78
GRADE HOLSTEINS**

62 head of milking cattle and the balance are bred heifers.

Few outstanding records:

Naomi	17959	3.5	628
Roseann	20313	3.5	701
R. Bush	17551	3.5	614
Terisa	16300	3.7	606
Carol	15658	3.4	538

This is almost an entire herd of young ABC and ABS sired home raised, cattle with lots of dairy character and plenty of potential. These cattle are presently being milked in a milking parlor and are not being overfed for high milk production. If in need of milk attend this sale. DHIA records furnished with the cattle.
