

Harvestore® and Slurrystore® help make both ends of your dairy business more profitable.

These big blue Harvestore structures are a familiar sight on dairy farms all over America. As a matter of fact, our very first ones were constructed on dairy farms over 25 years ago, and are still feeding the cows.

Thousands of dairymen have found that owning a Harvestore system is just like adding extra hours to the day and extra acres to the farm. Why? With a Harvestore structure, you can forget about baling hay, hauling it, stacking it, unstacking it and breaking bales. You just cut it, chop it and blow it into the structure. The feeding becomes as simple as pressing a button.

A Harvestore structure can also be a natural for storing corn silage or high-moisture grain.

Well, as we said, thousands of dairymen already know that story—perhaps you're one of them. But, maybe you haven't seen the latest member of our Harvestore dairy profit team. We call it Slurrystore, because it stores manure in a liquid form—out of the way, out of sight and secure—to help you avoid contamination of streams, ponds, or ground water.

On most dairy farms, Slurrystore can store all of the manure produced for periods of up to 6 months which means you can spend your time on other things and apply the manure whenever it is most convenient to do so.

We're proud of this newest member of the Harvestore family and we sincerely believe with the Harvestore System and Slurrystore System you can make both ends of your dairy business more profitable.

WHY . . .
you should order your new Harvestore Silo Now

1. Winter Discounts
2. Spring Settlement
3. 10 percent investment credit
4. 6 month Depreciation
