

PROTEIN:

why purchase it when you can grow it?

Are you paying hard cash for protein you could grow? Do your present forage crop harvesting, storing and feeding practices cost you valuable nutrients? Did you know, in some areas, it is possible to produce twice the nutritional value per acre as haylage than you can as hay . . . and with 75% less labor?

Did you know 90% of the digestible protein in alfalfa is in the leaves? Top quality alfalfa haylage will score 20 to 25% crude protein.

When you put properly cut haylage in a Harvestore structure,

you store more leaves, thus more nutrients. You save on labor. You reduce storage losses. You beat the weather. You increase storage capacity. You assure top palatability. You reduce field losses. You save money on insurance. In short, you get maximum benefits from your cropland.

P.S.
 Old McDonald
 has bought a
 Harvestore!
