What's new

NEW CASE 700
SERIES DRAWN-TYPE
PLOW AVAILABLE IN
6 TO 10 BOTTOM SIZES

J I Case Company has introduced the new trail-type Model 700 moldboard plow. The plow is available in six to 10 bottom sizes with 16 or 18 inch bottoms. Equipped with an on-land, pull-type hitch that provides a favorable line of draft, the Model 700 works easily with tractors equipped with dual wheels. It can plow a strip 15 feet wide in one pass.

Features of the new plow include up to 3 1/2 inches of

underclearance and 30 inch rank on the 16 inch bottoms, 29 inch rank with 18 inch bottoms. A basic six bottom frame is constructed with a heavy-wall 6 x 8 inch tubular steel backbone that holds bottoms firmly in line through rough ground. There are no braces to catch heavy stalks and other trash.

The Model 700 trail plow is available with general purpose or stubble bottoms. Units are offered with a choice of three beam trips: spring automatic reset, spring cushion trip or heavy-duty shear pin. There is a wide choice of coulters.

PUBLIC SALE

On the farm located one mile West of Westminster just off Uniontown Road in Carroll County, Md.

MONDAY, MARCH 28, 1977

11:00 A.M.

FARM MACHINERY

A LARGE TRACTOR

John Deere 4230 Diesel with 1000 hrs., in excellent condition.

ENSILAGE EQUIPMENT

NH 880 chopper with 2-row 30 ft. corn head, direct cut head, pickup head; tow No. 115 JD chuck wagons, Badger silo blower.

HAY EQUIPMENT

NH 479 haybine (used one season), NH 256 hay rake, Lily wheel rake, MF No. 124 baler w/thrower (used one season), 20 ft. elevator, 2 wagons w/high sides.

PLOWING, TILLING & PLANTING EQUIPMENT

MF No. 82 five bottom plows 16", MF 10 ft. chisel plow, JF sub-soiler, MF No. 52 disc, Brillion 13 ft. cultipacker, JD grain drill (planted only 150 acres) with liquid fertilizer attachment.

OTHER EQUIPMENT

Woods No. 120 rotary mower, John Blue 300 gal. trailer sprayer with booms, Shaver post hole digger, NH No. 516 manure spreader, cement mixer (3 pt.), V blade snow plow, 1969 Ford pickup truck, Ford dump truck, two 185 gal. saddle tanks with 3 pt. hitch booms, 2 fertilizer boxes for AC corn planter.

NOTE: Owner is moving to Ohio to continue in the dairy business June 12th, and the remaining machinery including 3 tractors, feeding equipment, small tools and all dairy equipment will be sold June 17. This equipment can be seen on sale day including complete milking parlor and 3 bulk tanks.

SUPERSEEDER

OZARK, Ala. - Reduced production costs and increased crop yields are being credited to an impressive no-till system recently introduced as the SuperSeeder.

The two-, three-, four- or six-row machine will plant prepared or semi-prepared land, directly into sod or a standing cover crop like rye, or even behind grain immediately after combining. Only one operation is necessary to chop, disc, plow, harrow, plant and fertilize crops.

In fields sprayed with a residual herbicide at planting, the need for further tillage is eliminated until harvest. Converted into gallons of diesel fuel, the SuperSeeder requires about one gallon of fuel per acre from land preparation to harvest instead of the average requirement of 5.3 gallons per acre used in conventional planting.

Greatest advantages are realized when planting into a standing cover crop. Rye, for example, provides a mulch which protects soil and young plants from the impact of hard rain, slows water run off, reduces soil erosion and reduces blowing and washing away of fertilizer, herbicides and insecticides.

The farmer's constant concern with rain is further decreased since planting can be started earlier after a rain because land preparation is unnecessary. And a rain is not required to

germinate seed since the seed bed is not dried out in the planting operation. The SuperSeeder also contributes to favorable harvesting conditions because no-till ground is firmer, not as sticky and fields have fewer gullies.

Greatest production increases are attributed to the work of the SuperSeeder's in-row subsoiling foot which breaks through the "hard pan" or plow pan. Formed from the weight of heavy equipment running over a field, this soil compaction area which roots cannot penetrate is usually two to four inches thick and located six to fourteen inches below the surface. Given access through the hard pan, a plant's root system will spread to a depth of six feet and a width of four feet within 45 days after planting. The plant can then feed from six feet of earth instead of six inches. Utilizing a larger water and nutrient supply, a crop will hold up during the moisture stress of a drought period. Elimination of trips across the field also greatly reduces the formation of the plow pan.

The Brown - Harden SuperSeeder is available in two and three row lift types and four and six row pull types from Brown Manufacturing Corporation in Ozark, Alabama.
