Save Energy and get
FREE HOT WATER...
with the revolutionary...

The Mueller Fre-Heater conserves energy and provides "free" hot water by capturing the heat now wasted!

HERE'S HOW IT WORKS

Rather than using noisy, dust-creating fans with fragile, dirt collecting air-cooled condensers, the refrigerant is routed to a specially designed condenser/heat exchanger and its heat is transferred to the water.

A thermostatically controlled valve delivers 145° F water to a storage tank.

In addition to the thermostatic valve, a mixing valve is provided to permit "prepping" temperature water.

Thus, the Fre-Heater delivers two temperatures of water - prepping and washing.

Tests indicate the Fre-Heater consumes 10% less power than an air-cooled system... and you get Free Hot Water!

ELIMINATES REFRIGERATION SERVICE PROBLEMS!

The most common causes of slow cooling in bulk milk cooling systems are related to the air-cooled condenser.

The Fre-Heater eliminates these problems because:

- There is no air-cooled condenser
- The Fre-Heater is installed indoors
- There are no noisy fans to fail
- The head pressure is very stable - assuring longer compressor life.
- There are no cold weather starting problems, plus... the Fre-Heater conserves energy and produces Free Hot Water!

HOW MUCH WATER CAN BE GENERATED?

There are many variables, so this question cannot be answered directly, however, a rule of thumb is that a Fre-Heater operating on 60° F. well water will produce a volume of 145° F. water similar to the amount of milk produced during a milking.
