"Cide" means to kill

LITITZ — Each year thousands of blameless children are accidentally poisoned by ingesting hazardous substances because adults fail to practice poison prevention

In addition to over-

the-counter drugs, household cleaning supplies, air fresheners, and many other items located in our homes including some plants, there is another substance typically found on all farms and most households that

requires our utmost concern Pesticides

As spring-planting season approaches, it's a good idea to focus on safety preventions necessary when mixing, applying, storing, and disposing of pesticides. Before using a pesticide be familiar with first aid treatment associated with the chemical

Remember pesticides are chemicals used to kill pests. Don't let pesticides become humanicides! Always

read the instructions on the label before opening a container

Wear personal protective equipment when handling pesticides. Now is the time to check equipment and make sure it's in good condition. Use rubber gloves, goggles and respirators for your protection. Rubber boots, rubber suits, hats and other protective gear may be necessary when handling highly toxic materials. Respirator filters

should be replaced every eight hours, or if you smell pesticide odors while wearing the respirator. Wash the mask with soap and water each time a new filter is installed.

Rubber gloves should not have a cloth lining and should reach well beyond the wrists

Store pesticides in a separate room or building that can be locked. A sign on the door should warn of the contents. Store paper pesticide containers off floors. Keep liquid containers in a locked area until they can be disposed of properly

Take the following precautions to protect children

Keep children and pets well away from the areas where you mix, apply, or spray chemicals

Keep children, pets, and playthings where spray will not land on them

Do not let children or pets play on pesticide equipment or in storage area. Storage areas should be locked at all times.

Never put pesticides in empty pop bottle or other food containers. Small children don't know the difference

Keep all pesticide containers away from children. Remember, even empty ones may be poisonous

In the event of a poisoning accident, call your doctor. Also be sure to take the poison container with you to the doctor

Poisonings are tragic. Poisoning accidents can be prevented if we observe the necessary and yet often common sense precautions involved in poison prevention. Take time this week to poison-proof your home and farm to make them safer places for us and especially our children
