Quick test for sulfa in hog feed soon available

WYNDMOOR — A fast, simple and inexpensive test for detecting sulfa drug residues in hog feed has been developed by Daniel P. Schwartz, a U.S. Department of Agriculture scientist.

"With this test, an untrained person can screen a feed sample for sulfa in only 10 minutes," says Schwartz, of the Science and Education Administration's Eastern Regional Research Center, near Philadelphia. "And it can save swine producers, feed manufacturers, and inspectors time and money since feed samples need not be sent to a laboratory for analysis."

Pork producers are permitted to

feed hogs limited amounts of sulfa drugs to promote faster weight gains, and to control atrophic rhinitis, a respiratory disease of swine. Schwartz noted this disease causes a significant portion of the \$400 million loss annually from all swine respiratory infections.

Pork producers are required to stop using sulfa drugs in hog feed at least 15 days before slaughter, according to Food and Drug Administration regulations. USDA monitoring found, however, that a substantial percentage of the hogs reaching slaughter plants had excessive sulfa residues in their liver tissues.

The high violation levels were

traced, by USDA scientists, to contaminated feed inadvertently used during the 15-day withdrawal period. Non-medicated feed was being contaminated by left-over sulfa medicated ingredients in feed mixing equipment and storage bins. Only a gram of sulfa — about the equivalent of two aspirin tablets — in a ton of feed is sufficient to create illegal sulfa levels (0.1 part per million) in liver tissue of swine.

The test has been prepared in kit form and field trials have had good results, according to Schwartz. When more than 0.15 parts per million of sulfa are present in the feed being tested, the test solution turns from colorless to lavender.

HOG PRODUCERS!

Get Top Price for Your Hogs at New Holland

Sold in sorted lots the auction way. See them weighed and sold and pick-up your check.
