

# WHERE FARM EFFICIENCY BEGINS...

From the time your HARVESTORE® Structure begins as a steel coil unit its construction on your farm, people trained and experienced, handle the unit with professional care.

Heavy steel rolls weighing 13 to 20 tons are the raw material from which Harvestore structures and Slurrystore systems are manufactured.

## FEATURES

- \* Glass-fused-to-steel.
- \* Breather bags.
- \* Steel floor.
- \* Permanently mounted center fill pipes.
- \* Galvanized steel spiral-wrapped blower pipe.

## OPTIONS

- \* External breather system.
- \* = Side entry fill
- \* = Ground control system.

Harvestore's breather bag system is the secret to maintaining an oxygen limited environment. As temperatures rise and fall any feed storage structure must breathe to equalize pressure. In conventional systems this means that air enters the feed with every daily cycle.

Glass-fused-to-steel sheets are carefully removed from the glass coating line and stacked on pallets to await shipment.

Loaded trucks each carrying a Harvestore structure or Slurrystore system, prepare to leave DeKalb for farms and ranches in all parts of North America.

Cross-section view shows how sheets are joined together. Sealer flows between sheets and around plastic-capped bolt to assure a tight joint.

Building crew erects a structure "from the top down," jacking it up as each ring of sheets is bolted into place. Torque wrenches are used to set each bolt. (Safety Guards on building scaffold have been removed for photographic purposes.)

**ADD IT ALL UP, AND YOU'LL SEE WHY WE SAY A HARVESTORE STRUCTURE IS MORE THAN JUST A SILO. IN FACT, THERE'S ABOUT AS MUCH SIMILARITY AS THERE IS BETWEEN YOUR BIG NEW DIESEL TRACTOR AND GRANDPA'S TEAM OF HORSES.**
