Conservation field day

(Continued from Page A36)

stream and trampling its banks, Gugulis said.

A waterway was carved through the crop field, seeded, and covered with a Curlex blanket consisting of a layer of excelsior made from aspen between two layers of nylon netting. It will keep the seed from washing away during storms. Both the excelsior and net decompose after about 9 months, she explained.

Across the road on another hillside, a no-till Haybuster drill was being used to renovate a sparse hay field with legumes. Conventional tillage would have subjected the steep hillside to serious erosion. The improved hayland will provide better erosion control and more nutritious feed for the cows.

Visitors could also see an animal waste storage structure which had

been in operation for several years. The structure stores the waste from 100 cows for up to 90 days. This saves on the time, labor, and fuel required for daily hauling. Field application can be timed to the fertilization needs of the crop and to weather conditions, thus lessening the chance of runoffs and water pollution.

About a mile down the road, contour stripcropping was being demonstrated.

"Some farmers tell us they can't afford to install conservation practices," Unangst says. "Actually, they can't afford not to. What are they going to do when their soil and the fertilizer washes away? What we're doing at this field day is demonstrating some cost effective methods to save soil and conserve water which will help increase and maintain productivity."
