Big bales "breed" stable flies

COLUMBIA, Mo. — Those same storage practices that reduce spoilage of large, round hay bales also reduce the breeding sites of pesky stable flies.

In a 12-site central Missouri study, researchers found stable fly larvae or pupae in the under-surface of most bales stored outdoors—unless the bales were wrapped in plastic or stored on crushed rock.

The study was conducted by entomologists Robert D. Hall, University of Missouri-Columbia, and Gus Thomas, USDA's Agricultural Research Service. Thomas works out of the USDA's

Biological Control of Insects Laboratory in Columbia.

During a survey last summer, Hall and Thomas found that hay bales in a state of decay during the wet summer appeared less attractive to stable flies than actively fermenting bales that were only a few months old.

Thomas said farmers can reduce spoilage and stable fly breeding sites by: (1) aligning bales on a north-to-south axis to permit sunlight penetration under rounded edges, (2) moving bales to well-drained sites, and (3) leaving a space between bales to promote drainage.
