Pesticide computer in operation

WASHINGTON, D.C. — A computerized system that quickly retrieves up-to-the minute facts about registered pesticides across the country passed from the pilot stage to full operation Oct. 10.

Management of the system will continue at Purdue University, West Lafayette, Ind., where the successful pilot program originated.

Called NPIRS, short for National Pesticide Information Retrieval System, the system was developed at Purdue in cooperation with three U.S. Department of Agriculture agencies — the Cooperative State Research Service, the Extension Service and Agricultural Research Service.

Jim White, the system's user service manager at Purdue, said NPIRS provides the latest information about key characteristics of pesticide products registered by the U.S. Environmental Protection Agency and participating state regulatory agencies through a computer network.

Users of the system pay what White called "nominal membership and user fees."

White said the service is available to member organizations such as land-grant universities, state and federal regulatory offices, state and federal scientists, the pesticides industry, various user groups and organizations and others working on pesticide-related activities.

"The service fills a long-recognized need," said White.

"In the past," he said, "by the time a compendium of pesticide changes was compiled and issued, it already was out-of-date. Now,

through the computer network, which contains EPA and state registration date updated regularly, NPIRS members can rapidly acquire timely pesticide information."

During the past year, procedures for the system were tested in programs involving 12 states, the USDA, EPA and representatives of private industry.

"Already, 30 state agencies, a dozen industries and a half-dozen governmental agencies have signed up for the service," said White. "Inquiries showing strong interest have been received from nearly 100 other groups, institutions and industries."

Customers of the system can get pesticide label information, including active ingredients and products, via dial-up on standard computer terminals. They also can search for sites, pests, EPA registration numbers and brand names at both the federal and state levels.

Entry of state date is optional for the states.

"Indications are that most states with pesticide registration programs will submit their state date for use in the program," said White. "Twenty-three states already are committed."

White said the service should prove especially valuable to agricultural and pest control consultants, Extension Services, Agricultural Experiment Stations, regulatory agencies, pesticide-associated industries, trade and professional associations, teachers and others.

He said a user's guide has been completed and will be available to those who join the system.

Pigs in print

"He is not suspicious, or shrinkingly submissive, like horses, cattle, and sheep; nor an impudent devil-may-care like the goat; nor hostile like the goose; nor condescending like the cat; or a flattering parasite like the dog. He views us from a totally dif-

ferent, a sort of democratic, standpoint as fellow citizens and brothers, and takes it for granted, or grunted, that we understand his language..." — William Henry Hudson on the pig, from *The Book of a Naturalist*.
