Brockett's Ag Advice

By John E. Brockett
Farm Management Agent
Lewistown Extension Office

Are You Ready?

Are you ready for planting time? When was the last time that you really looked at your spring cropping plans? A lot of farmers are not going to get as much money as they would like for crop needs. Some are going to get all of the money they want but won't use it as wisely as they could.

Are finances going to be tight this year? If so you could probably gain by soil testing, setting fertilizer priorities, planning on needs, and following a budget. Are you ready? Only you can answer this question but many farmers could reduce crop planting costs without reducing yields if they knew how many nutrients were needed, which weeds were a problem, and whether they have a built in insect problem.

Can You Save?

Can you save on crop costs? Here are a few suggestions: (1) Take good care of lime needs - it is the key that you need to make everything else work; (2) Feed your plants a balanced ration; (3) Don't be in a hurry to tear up an old hay stand - it may be cheaper to renovate than to replant; (4) Use an alfalfa-grass mix instead of just alfalfa-seeding is cheaper and life of stand will probably be longer; (5) Plan to satisfy your forage needs first if you are a dairy or livestock farmer-good quality forage is the number one factor in reducing the cost of producing milk or meat; (6) Know what pest you have to control-shotgun measures can be costly; (7) Drive your equipment carefully - you

save fuel, repairs and perhaps lives; (8) Practice a good maintenance program - you save time, aggravation, and bills.

Temporary Crops

Every year I get a question "should I grow annuals such as sorghum or rye?" Every year I answer in the same way "yes as an emergency crop but not as a permanent crop". There has been some research that shows a group of crops called "brassicac" to be very productive if pastured. Most of you know this group of crops under their more common names of turnips or rape. You might ask your county agent for some information about them. They are a relatively inexpensive crop to grow.

Let's go back to sorghum (and its many crosses with sudan grass) and small grains. They both make better feed than snowballs, straw, oak leaves, junky hay or a lot of other things. We have had heifers get fat on sudan grass pasture. Cattle relish both crops as green chop. Chemical tests appear to be nearly equal to corn silage in many respects. However they are not usually as good as the old corn silage and alfalfa-grass forage combination for stored feed. So use them in limited quantity for "in-between feed" or "emergency feed" or temporary crops. They will do fine in that role. Don't go overboard on them. Remember that farmers have made money with good alfalfa or alfalfa-grass forage for years. We have not yet found an adequate replacement for it. Likewise with corn silage.

SCS reports transfer

CHAMBERSBURG — Stanley Palmer, Soil Conservation Technician, has recently transferred to the Chambersburg Field Office from the McConnellsburg Field Office, reports John R. Akers, District Conservationist with the Chambersburg office of the USDA Soil Conservation Service.

Palmer will be assisting Franklin County farmers to install conservation practices such as diversions, contour strips and cropland terraces to reduce soil erosion and control surface runoff.

There are about 1,000 farmers and other landowners who over the past years have requested assistance in establishing conservation practices on their land.

With over 25 years of experience with the Soil Conservation service, Palmer is prepared to assist the people in Franklin County, states Akers.

Palmer is replacing David Hoffman, who was transferred to Nanticoke to supervise strip mine reclamation work in Luzerne County.
