For the avid gardener

A successful garden needs water but there are time when we have too much. Water logged or saturated soil is definitely a problem in some gardens this spring. If your soil is wet, be patient. Working wet soil can destroy soil structure.

Soil in good condition is called "Friable." Friable soil is loose textured and composed of many well-defined particles with plenty of pore space between them. The best comparison I can think of is a bowl of popped corn. Each popped kernel represents a soil particle and the spaces between are pore spaces, says C.R. Bryan, Jr. Delaware County cooperative extension service director.

When wet soil is worked, the soil solution (the water in soil particles) allows the mineral fractions of sand, silt and clay to slide or run together destroying the pore spaces between particles. Actually, the particles collapse producing material similar to what would

happen if you took a bowl of popped corn and rolled each kernel flat with a rolling pin before returning it to the bowl.

You can tell if your soil is too wet to work by forming a ball of it in your hand. If the soil sticks to your fingers, it is probably too wet. If, however, the ball of soil holds together when release, but falls apart when you gently tap it with your finger, it is friable and has a good mix of soil and moisture and air. It is ready to be worked.

Damaged soil structure is slow to recover. It takes a number of seasons to separate the mineral fractions again and increase the pore spaces. If your soil structure is poor, incorporate organic matter and add limestone according to your soil test results. It is far easier to keep your soil in good condition than it is to rebuild it, so be extra careful this spring and don't work your soil when it is too wet. Penn State is an affirmative action, equal opportunity university.
