May-Co Silo Liners

In fermenting crops, such as alfalfa, corn, sorghum and high moisture grains, certain bacteria change carbohydrates into organic acids, principally lactic and acetic acids. These acids are nature's own food preservatives and mold inhibitors. When enough of these milk acids are produced, the fermentation stops and the feed is preserved. However, the bacteria that make these organic acids do not grow in the presence of oxygen. The flow of oxygen can be eliminated by installing a MAY-CO SILO LINER inside your silo, which also eliminates juice run-off. In an oxygen free ferment, the silage will not freeze to the silo wall, will not shrink, will not mold or heat between feeding even in hot weather, and will produce more T.D.N. and Digestible Protein without an additive.
