May-Co Silo Liners

In fermenting crops, such as alfalfa, corn, sorghum and high moisture grains, certain bacteria change carbohydrates into organic acids, principally lactic and acetic acids. These acids are nature's own food preservatives and mold inhibitors. When enough of these milk acids are produced, the fermentation stops and the feed is preserved. However, the bacteria that make these organic acids do not grow in the presence of oxygen. The flow of oxygen can be eliminated by installing a MAY-CO SILO LINER inside your silo, which also eliminates juice run-off. In an oxygen free ferment, the silage will not freeze to the silo wall, will not shrink, will not mold or heat between feeding even in hot weather, and will produce more T.D.N and Digestible Protein without an additive

Main Features of a Sollenberger Bottom Unloading Silo

- 6" Solid Concrete Wall
- No Drying Expense
- Reduced Shrinkage and Spoilage
- Continuous Filling and Feeding
- Lower Field Losses
- Lower Feed Cost

Since the early 1900's, Sollenberger Silos has been designing and constructing monolithic concrete silos. Always concerned with quality construction, Sollenberger continuously strives to improve their products as engineers study and design new innovations for strength, utility, and efficiency.

With local dealer-representatives throughout the Mid-Atlantic area, we can continue to provide these quality silos to a large number of farmers.

Before you buy any concrete silo compare Sollenberger's quality construction and features. Every Sollenberger Silo has full 6" solid steel reinforced quality controlled concrete walls. Compare this with other concrete silos. Our thicker stronger walls help silage remain at a relatively constant temperature resisting freezing and heat damage resulting in less spoilage and better silage.
