## **FARM FORUM**

## (Continued from Page A10)

method of production down to a horse and plough to make his small farm profitable; he can make a better living with a tractor-but a simple affordable tractor rather than several large high technology tractors.

While Butz extols the virtues of large farms, it is important to realize that there are many advantages to encouraging small farms. Among the many advantages, the most important is probably the fact that it creates jobs-it promotes employment in an area of production in which it is actually preferable for many to be employed. Anyone who is pushed out of farming has a good chance of ending up in a much less desirable field, most likely working for someone else-no longer enjoying the satisfaction of being selfemployed. Small farms better stimulate the local economy while often producing a more high quality product like locally grown vegetables. Small farms are also more able to practice environmentally sound farming practices which protect the community around them from various forms of chemical poisoning. If the research monies which are being invested in promoting large farms were directed toward investigating the most ideal techniques for small farmers, then small farmers could hone their operations into peak performance efficiency and there would be no reason for so many financial failures among small farmers The point is that the agricultural community must now ask itself, is this just a business, or is farming also a way of life? Is Butz correct when he puts down politicians for their "emotionalism" when they want to enact measures to "save the family farm"? Or should we reevaluate the direction in which the agricultural community should go?

Sincerely. Jane T. Kellett Fairfield
