Improving water infiltration may increase crop yields.

Soil conditioning alters the physical properties of soil in ways that fight erosion, save water or improve plant growth.

The ingredients in Basic-H Concentrated Soil Conditioner have been shown to improve water infiltration, or penetration. This is generally known to have many possible benefits on farms, including improved soil aeration, reduced runoff, reduced erosion, water conservation and increased crop yields. The results you obtain depend on conditions in your own field and your farming practices.

Basic-H Concentrated Soil Conditioner may also enhance the relationship between water, soil and plants. This can help your farm in many ways, because the way that crops get water and nutrients depends on the way that water moves through soil.

Helps promote uniform water penetration

In carefully controlled field studies, Basic-H Concentrated Soil Conditioner substantially increased water infiltration, or penetration, on eight wettable soils. These experiments were all repeated five or six times, producing statistically significant results with a 95% confidence level. This means that the same results would be obtained in 19 out of every 20 experiments.
