STRAIGHT TALK ABOUT FASTER BALING

Uniquely Designed Case International Balers Put Crop Quality Into Every Bale

This Baler Can Save Thousands Of Dollars With Increased Milk Production In Greatly Reduced Heat Loss Obtained With Our Direct Feed Crop Flow System - (Unbiased Testing Has Proven The Facts)

Your Best Buy in Balers is From Binkley & Hurst Bros., Inc.

The Baler That Works!

WHY STRAIGHT IS BETTER THAN SIDEWAYS . . .

- Reason #1 Transport width ranges from 7'11" to only 8'66" on our 8550 Model Conventional balers are generally 1-foot wider in transport
- Reason #2 No need to widen our baler out once you're in the field or narrowing when leaving the field. The conventional baler must be narrowed and widened. Reduced time and effort means money
- Reason #3 Never a need to pick up bales when opening a field and cropping them on the ground — you can even leave the bale thrower on and drop the back chute. Since the baler and tractor straddles the windrow, the bales dropped on the ground from previous rounds never interfere with the operation
- Reason #4 Gauge wheels are mounted on both sides for better performance. Not so with conventional balers
- Reason #5 Our pickup is half the height of conventional balers. This means less leaves are lost because less travel distance up and over the pickup is required. An optional hydraulic pickup lift is even available
- Reason #6 Conventional balers use high maintenance cross feeders or sweep arms to move hay to the chamber. Our baler feeds hay from the pickup straight into the chamber by the use of a simple stuffer mechanism. Leaves don't fall to the bottom of the chamber and later fall out the back. Due to our design, leaves are placed evenly throughout the bale — the leaves are not given time to settle to the bottom
- Reason #7 Due to our design, our plunger stroke distance is 25-30% less than conventional balers. Example John Deere 327, 337, 347 and 467 Models = 30" stroke, Case IH 8520 = 21 1/2" stroke and a high of 23" on our 8550. The result: Less wear, less side to side stress force and less repairs!
- Reason #8 The clearance of our needles from the ground far exceeds conventional balers due to the high position of our chamber. This translates to less breakage and bending of the needles due to hitting high places in the field, etc.
- Reason #9 We have equal baler weight distribution on both carrying wheels for easier handling and less side pull on hills
- Reason #10 The distance from the end of our bale chamber to the thrower belts is enough so that the thrower doesn't fight the bale, i.e., the bale is not still wedged in the chamber when the thrower first contacts the bale
- Reason #11 Our bale edges are sharp and corners are square on all types of hay — excellent when stackers are used or hay is hauled by truck
- Reason #12 Proven and reliable Deering type knotters on all center line balers
