N4640

(K4263) RM: 101-105

An exceptional hybrid for early corn, silage or early harvest, N4640 offers extremely high yields of dry grain. Superior stalk strength and excellent ear retention permit field drying. Ideal for upper tier counties of Indiana, Ohio and Pennsylvania. Adapts to a wide range of plant densities. Responds well to higher populations. White N5220 and N5866 may show faster early growth in abnormally, cold, wet conditions. N4640 displays excellent yield stability.

N6822

RM: 110-114

A 1994 NCGA champion in Pennsylvania and New Jersey, this outstanding hybrid also offers top performance across central Indiana and Ohio. Very good staygreen helps N6822 maintain exceptional yield potential under continuous corn or standard rotations. Very good standability and drought tolerance also support yields. Performs well on medium to fine textured soils at moderate to high plant densities. Semi-flex ears produce good quality, heavy test weight grain with good shellability.

N7590

(K7782) RM: 112-116

Exceptionally high yield potential could make this new hybrid your top producer. With excellent early growth, N7590 becomes a strong choice for no-till fields. It flowers and sets up grain slightly later than PY9540 and S7751, although grain moisture at harvest is similar. N7590 responds well to higher plant densities. Superior stress tolerance helps you maintain yields. Short shanks that hold ears close to the stalk can surprise even the best yield estimators.

N7448

RM: 112-116

Excellent standability, superior staygreen and a good foliar disease package helps this newer hybrid deliver maximum yields in stress environments. A long grain-fill period also contributes to high yield potential. Heavy test weight grain dries down exceptionally fast. N7448 is a good hybrid for both no-till systems and continuous corn in mid-Atlantic states and southern Ohio. Performs best at moderate plant populations.
