Performance Starts here With Superior Design Row Units

KINZE ROW UNITS

THE KEY TO EARLY SEED GERMINATION

You start with a simple, dependable row unit design with easy adjustments that give you exact depth control, and the most ideal seed-to-soil contact possible. At KINZE we call it "Precision Placement." Simply put, it's the toughest most dependable system in the field today.

How does it work? At the exact point of seed placement, 15" double disc openers and dual gauge wheels combine to mold a clean, consistent V-formed seed trench at a pre-set depth. Trailing V-closing wheels then securely press the seed trench walls on each side of the seed for positive seed-to-soil contact, virtually eliminating air pockets and leaving a loose "hill" of soil on top of the seed. It's the ideal environment for the emerging seedling.

Each row unit is independently adjustable for depth and down pressure. Spring-loaded parallel arms give you all the flexibility you need. Down pressure? Your choice. Standard, quick-adjustable dual springs for conventional planting, or quad springs (shown right) for conservation tillage. Each with four positions so you can set the unit's down force for your conditions.

Not Only Do We Have Your **PARTS**
