Saddle Tennessee Walker Cutback, excellent condition - \$225. English general purpose Toklat coolback saddle pad, red, used one - \$30 717-938-5273 York Co

# Hog Building Designs Topic Of Pork Congress

COLUMBUS, Ohio — Not all pigs are created equal, and their homes shouldn't be either, said Dale Ricker, swine associate at the Putnam County office of Ohio State University Extension.

Farrowing buildings and nurseries where baby pigs are born and housed should be kept warm, while buildings designed for finishing—where older pigs are readied for market—should be kept at around 55 degrees to 60 degrees Fahrenheit, Ricker said. That's because a mild, dry environment is better for the health and growth of finishing hogs than a warm, humid environment is better for the health and growth of finishing hogs than a warm, humid environment.

To learn more about the topic, early arrivals to the 1998 Ohio Pork Congress on Friday, Feb. 20, can participate in the Building Design and Ventilation Alternatives sessions presented by Ohio State University Extension from 8 a.m. to 10 a.m. Subjects discussed will include breeding and gestation building design, farrowing and nursery design and ventilation alternatives, wean to finish building design and management, grow/finish buildings, and hoop structures.

"Hog prices aren't too good now, but there has been some money made in pork production the past two years, so producers are able to invest in new or remodeled buildings," Ricker said. "We try to do programs that producers will be interested in, and we've been getting a lot of questions about building design in the past year."

Designs for all the stages in pork production will be covered, from breeding and gestation through finishing. Through slides and discussion, participants should get a good overview of what types of structures have been built recently, Ricker said.

"This session should be good for all producers, whether they're doing something now, next year or the year after," he said.

Ventilation, especially of farrowing and nursery buildings, also will be discussed. Ventilation systems continuously remove the heat, moisture and odors created by livestock and replenish the oxygen supply by bringing in drier, cooler outside air. Air exchange also removes gases such as ammonia, hydrogen sulfide and methane that can be harmful to both animal and operator health.

Other Ohio State University Extension presentations at Pork Congress will be composting swine mortality certification seminar, also on Feb. 20 from 8 a.m. to 10 a.m., two sessions each on swine health and the Internet, and the Swine Health and Technology Corner with veterinarians and Extension Swine Team members available throughout the Congress to answer questions.

The Swine Health sessions will take place Feb. 20 and Feb. 21 at 10 a.m. Topics discussed during Friday's session will include Segregated Early Weaning (SEW) Nursery Health Management, and Porcine

Reproduction and Respiratory Syndrome (PRRS) and Swine Influenza Interactions. Saturday's topics include Emerging Diseases, and Hazard Analysis and Critical Control Points (HACCP) Impact at the Farm Level.

The Internet sessions will cover what pork information is available on the Internet, what type of computer producers will need, where to start and how to get hooked up.

"About 30 percent of farmers use computers, but we'll mostly be focusing on the 70 percent who don't and answering questions they may have," said

David Meeker, director of Ohio State's Ohio Pork Industry Center.

The Internet sessions are scheduled for Feb. 20 at 2 p.m. and Feb. 21 at 1 p.m.

The Ohio Pork Congress is Feb. 19 to Feb. 21 at the Dayton Convention Center. For more information regarding the Congress, call the Ohio Pork Producers Council at (614) 882-5887, or visit their website (<http://www.ohiopork.org>). For more information about hog building designs and ventilation, contact county offices of Ohio State University Extension.

## Ag Land Preservation Board Holds Elections

SUNBURY (Northumberland Co.) — The Northumberland County Agricultural Land Preservation Board elected officers for 1998 during a recent meeting. David L. Unger, Rush Township, was re-elected chairman of the board and William Geise, Point Township, was re-elected as vice chairman. Carolyn Badman, Sunbury, was elected as secretary-treasurer.

Other members of the Preservation Board includes Donald Cotner, Rush Township, Clifford Levan, Turbot Township, Thomas E. Boop, Sunbury, and R. Craig Rhoades, Shamokin. The board officially welcomed Richard Daniels, Lower Mahanoy Township, who was recently appointed by the county commissioners.

The Northumberland County Agricultural Land Preservation Board is responsible for administering the farmland preservation program in Northumberland County. The board receives applications from farmers who want to sell easements on their farms to insure their land remains in agriculture for perpetuity. Applications are then ranked according to state and county program guidelines.

Program guidelines include an evaluation of the soils and an assessment of the farm's site.

## Seminar To Discuss Ways To Build With Nature

WEST PITTSTON (Luzerne Co.) — Today's home buyer is looking for a house surrounded by the beauty of nature.

In response to this demand, developers and homebuilders can create beautiful, healthy communities by building with nature.

Building with nature involves planning for and properly incorporating and conserving natural resources during development. Many developers have already recognized that commercial and residential construction can be more profitable when natural features are designed into the project and protected.

Without a clear understanding of the impacts construction activities can have on trees and natural resources, the features

Fifty percent of the soils must be available for agricultural production, according to capability classes defined by the USDA, Natural Resources Conservation Service. The site assessment portion consists of factors that consider development potential, farmland potential, and clustering potential. The farm must be located in an agricultural security area, with consideration given to the likelihood the farm will be converted to a non-agricultural use. Other criteria states the tract must be at least 50 acres in size, contain 50 percent harvested cropland or pastureland, and receive consideration for the farm's proximity to other farms with an agricultural conservation easement. In addition, the applicant must be a good steward of the land.

All applications are ranked on an annual basis. Prior to the board meeting, 10 active applications were scored according to program guidelines, and their rankings were determined. The board officially approved the priority ranking for the 10 applications.

One easement has been purchased in Delaware/Turbot townships. The board is optimistic another easement will soon be completed in Delaware Township, and they have begun the process to purchase a third one.

that attracted home buyers can quickly be destroyed. Today's home buyer's are better educated about the environment and natural resource issues and take an interest in the land on which they are building.

On Feb. 26, a seminar titled "Building with Nature - Protecting Trees and Natural Resources During Construction" will be held at Luzerne County Community College for the building industry and community planners.

Preregistration and a \$20 fee that covers written material, lunch, and breaks are required. For more information, contact Penn State Cooperative Extension at (717) 602-0600 or (717) 825-1701.
