### The Lowdown On Skateboards

What started as rolling down hills on a piece of wood with wheels is now a lot more. From leaps to turns to difficult flips, today's skateboarder does a lot on a little piece of wood.

But it's really much more than just a piece of wood. The skateboard has three main parts—the deck, wheels and trucks.

The flat standing surface of the skateboard is the deck. It is usually made from maple wood. The wheels are usually made from a material called polyurethane. They range from 39 to 66 millimeters across, which would be about 1.5 to 2.6 inches. The trucks are the front and rear axle assemblies. They connect the wheels to the board and allow the board to turn.

The front of the skateboard is called the nose, which runs from the front trucks to the front end. The tail, or back, of the skateboard runs from the back trucks to the back. Plastic strips that attach to a board's underside are called rails, which is also the edge of a skateboard.

The places people skateboard have changed, too. Skateboarding on streets, curbs and railings is known as street skating, skateboarding on ramps and vertical structures built for skateboarding is called vert skating.
