**TUNNEL VENTILATION + AERO COOL™ EVAPORATIVE COOLING = ULTIMATE COW COMFORT**

**Tie-Stall Barn  
Womelsdorf, PA**

**Evaporative Cooling  
for Dairy Tie-stall Barns**

The use of evaporative cooling for livestock and poultry in the northeast United States has been gaining acceptance in recent years. The main reason being that producers now understand that during the hottest part of the day, the relative humidity is often very low, which allows for the effective use of evaporative cooling. Since many tie-stall dairy barns now use tunnel ventilation systems for hot weather, dairy farmers can further enhance their hot weather ventilation by adding evaporative cooling pads. These systems work hand-in-hand to increase the amount of heat removed from the cow due to the high air speeds. The cost of the cooling system is minimized when designing it for tunnel ventilation compared to a cross-flow ventilation system.

**Call Cedar Crest to design your complete ventilation system.  
Let us show you a recent installation:**

**Evaporative Cooling Pad  
in 76 Cow Tie-Stall Barn  
Peach Bottom, PA**

**What is Evaporative Cooling?**

When water evaporates, heat energy is converted into a different form, which lowers the temperature of the air or the object that the water was on. As water evaporates the temperature continues to drop until the air reaches the 100% saturated point. In the northeast U.S. there is typically a 16 degree F. cooling potential on an average 90 degree day. Since most evaporative pad systems are designed to be 75% efficient, that means that a 12 degree temperature drop could be expected. When temperatures reach 98 to 100 degrees, there is often a cooling potential of up to 24 degrees, resulting in an 18 degree drop in barn air temperatures. **THE HOTTER IT IS, THE MORE COOLING YOU GET!**
