Bellefonte, Pa., Sept. 30, 1898.

FARM NOTES.

-Cabbage worms inflict damage until late in the season and various remedies have been suggested to prevent their ravages. In some sections the growing of cabbages has been abandoned altogether, owing to the labor of combatting the enemies of the plants. The cauliflower and all other plants of the cabbage family are also attacked. The green cabbage worm is the larva of the well-known white butterfly ("Pierie rapae,") imported from Europe, the insects passing the winter as chrysalids or pupae (the dormant stage) attached to the under sides of rails, sticks, weeds or any place where they are protected from moisture. Professor F. H. Hall, of the New York Agricultural Experiment Sta New York Agricultural Experiment Station, who has given the matter of cabbage pests his careful attention, states that the butterflies emerge from the chrysalid shells early in May, and sometimes in April if the weather is warm. The eggs, about 100 in number, are deposited singly upon the under sides and edges of leaves of old cab-bage stumps, early cabbage, kale, wild radish or other related plants. The egg-laying lasts about three weeks, by which time the worms from those first laid have hatched and are ready to pupate. Before the old butterfles die new broods are ready, and this overlapping of breeds renders the work of extermination very difficult, as the butterflies are constantly restocking the plants with eggs, five or more generations being thus prolonged during the season. Another destructive enemy, whose rav-ages are frequently attributed to the cab-

bage worm, is the cabbage looper. Hereside rendering colds almost impossible.

An occasional hot bath with plenty of good soap, followed by a sponging in cold water, is taken at night, but not more frequently than twice a week, as hot baths are enervating and encourage a loose, flabby condition of the skin. After the hot bath at night cold cream of lanolin is very voracious, eating not only plants of the cabbage family, but also lettuce, celery, spinach, tomatoes, carnations, smilax, chrysanthemums and many forcing plants. The worms, when partially grown, are marked by distinct white lines along the sides, and, unlike the ordinary cabbage sides, and, unlike the ordinary cabbage worms, they have legs only at the ends of their bodies, so that they travel by "looptheir bodies, so that they travel by "looping" and not by crawling. They also appear earlier and continue longer, with the same overlapping of broods. They feed upon a large variety of plants, and largely upon the under sides of the leaves, which makes their destruction very difficult. Plants of the cabbage family are specially difficult to treat with insecticides because of the crowding together of their leaves and the smoothness of the surfaces, the insecticides not always adhering, hence all applications must be so thorough that every spot of surface will be protected and the treatment repeated in order to insure destruction of the newly hatched worms.

The use of Paris green is considered the best and cheapest remedy, but it is applied with a "poison carrier," or mixture designed to cause the poison to adhere to the leaves. This mixture is composed of five pound pulverized resin, one pound concen-trated lye, one pint fish oil (or any cheap animal oil except tallow) and five gallons water. Place the oil, resin and one gallon of water in an iron kettle and heat until the resin is softened, and then add the lye solution (prepared as for hard soap); add the remainder of the water and boil about two hours until the mixture will unite with cold water, producing a clear, amber-colored mixture. If its boils away too much add enough water to make five gallons of the mixture. This will be the 'stock" solution, one gallon of which may be diluted with 16 gallons of water, to which must be added three gallons of milk of lime (whitewash). It is really a liquid soap, the lime being suspended in the water in minute particles. Now add onefourth of a pound of Paris green, stirring well. The soap solution will be found very adhesive and must be applied with a sprayer, care being taken that it reaches all portions of the plants, and especially the under sides of the leaves. This remedy has been found the most perfect of all preventives used and is perfectly safe, except that it must not be applied on cauliflowers after the "flowers" are exposed, as there may be danger of poisoning the human consumer. There is but little danger of poisoning the cabbage with the mixture, as only the outer leaves are touched by the spray and these are thrown away in preparation for the table. Apply when the plants are one-third grown and again just before the heads are formed. The cost is estimated not to exceed \$2 per acre.

-The disagreeable duties of winter consist in working in slush and filth in the stalls and stables, but which could be largely avoided if fine absorbent material is used. This is an excellent time, before the fall rains set in, to store away a plentiful supply of dry earth. It costs nothing but the hauling and will be found very handy and useful in the winter season. The leaves should also be collected and put under shelter. One of the valuable aids will be found in the fodder shredder, which reduces the stalks to the condition of excelsior, enabling the cattle to consume much that would otherwise be useless, and affording an excellent absorbent material at all times. The ensilage cutter will also be found useful in that respect, as it will pay to cut up the food for stock in order that all materials going into the manure heap may immediately absorb the liquids. The stalls will also be dry and warm and the work performed with greater comfort.

-Pigs farrowed this month will get a good start before winter. Late pigs are liable to be checked by severe cold. The most profitable pigs, however, are those farrowed in the spring and slaughtered late in the fall, as they need not be kept over winter. Farmers do not now give much attention to raising pigs farrowed in the fall unless they are patrons of a creamery and have an abundance of material for feeding, which only the pigs will consume.

—An excellent time to select feed corn is when it is being husked. All seed corn should be kept in a dry place, and if hung up where the air can circulate through it, so much the better. In some sections seed corn is injured in winter by severe cold. but this danger is not so great if the seed is kept dry.

-Some growers burn the strawberry clean straw or salt hay. By so doing weeds are destroyed.

—A special crop for the use of poultry is millet seed. The use of such seed for that

FOR AND ABOUT WOMEN.

Hot milk is the newest panacea for all complexion ills. If the face be wrinkled, sallow, freekled or otherwise afflicted, hot milk, says the enthusiast over this new remedy, will produce a cure. Converts de-clare that the face, after being washed with hot milk at night, feels wonderfully refreshed, while the skin soon becomes very white and soft. They also claim that a generous quantity of milk poured into the bath is positively magical in removing fa-

Excellent flavoring for custards and sweet puddings may be made at home with very little trouble or expense. Before cutting a lemon or orange wipe it dry; then grate off the yellow skin, being careful not the bottle tightly corked. The sugar becomes saturated with the volatile oil of the peel, and when used in the place of extract will be found to give a most delicious fla-

The modern maiden has learned in an exquisite way the science of the care of her person; she does not early acquire wrink-les. The secret, for such it is, of this preservation is one that all women should know; it surely is more charming for the world to gaze upon a fresh youthful face than upon a shriveled one, and upon an abundance of locks than upon too scanty a growth to even cover the head. Begin the day with a cool tepid sponge-bath, followed by a vigorous rubbing with a rough towel. This starts the circulation into almost a bound and does much to preserve the plumpness of face, neck and arms, be-

side rendering colds almost impossible. bath at night cold cream of lanolin is rubbed vigorously into the face or, if there are signs of yellow spots, zinc oxide oint-ment is substituted. The face is washed each morning with handfuls of warm water then immediately with cold water, thus stirring the circulation and aiding in keeprubbing particularly any wrinkling across the forehead. This is the ironing out of the face, preparatory to the appearance for the day. Wrinkles develop by a lack of suppleness and plumpness of the skin, and they may be kept at bay many years by careful massage.—The Delinaator.

Skirts have reached more reasonable proportions and they are no longer expected to trail upon the ground. They barely touch at the front and sides, but do drag somewhat at the back. Yet this extra length is easily handled, since the sides and front need not be lifted.

In this season of flounces and durable skirts the tailor-made gown is much over-trimmed. It is quite permissible for it to show a number of flounces, besides lace and ribbon trimmings.

Black will be much worn during the coming season. Even those goods which have always been considered peculiarly the property of mourners will be generally used, and as a rule without a contrasting

Added to this is the uncertain sentiment regarding the wearer of mourning clothes. Some cling to the time-honored custom and favor the deepest black, while others dis-

card it altogether. Braid is not used on street costumes in deep mourning. If any trimming is desired, bands and folds of crepe are used. For young girls the crepe may be replaced with dull black ribbon, which adds a touch of youthfulness.

For six months house gowns should be black materials, trimmed with black ribbons and chiffon. After that all white gowns, trimmed with black ribbons may be worn. Fine white lawns and the soft wool goods are admirable for these gowns and make up prettiest in the princess

For six months the widow wears the crepe veil, over a bonnet and the widow's cap. It is then discarded for a shorter repe. It is a good plan to remove the veil from the bonnet every time the bonnet is not in use and fold it carefully, as in this way it can be made at least any street, to figure ocated, pain continually in back and sides, no appetite—gradually growing weaker day by day. Three physicians had given me up. Fortunately a friend advised trying 'Electric Bitters;' this way it can be made to last much longer. Veils are not worn over the face more than a few days, after which they fall back and are worn with short face veils of net. Do not use mourning flowers on your hat; they are in exceeding bad taste. Mourning jets may be used, but only after the deep mourning has been discarded.

The new autumn capes and coats are already on view, and after a close examination the conclusion is not far to seek that volants, braiding, bands, and tailor stitching arranged in parallel lines or in designs, are the distinguishing features. The new jackets show considerable modifications when looked at carefully. They are, on the whole, smaller and neater in make, and show the influence of a long series of exquisitely finished tailor-made costumes Many of them have rounded, separately cut basques proceeding from the waist in front, and decidedly longer than those worn last year. The revers, on the other hand, are noticeably smaller.

The new capes are considerably deeper, standing out about half way down the skirt. When not finished with the inevitable deep flounce they are cut round enough to furnish fluted and undulating folds below. As the skirts are closely fit-ted at the hips, the outstanding effect of the cape below is good. Many long coats are shown, also, with a deep volant. This of course, is a necessity, as the skirts themselves are so much fluted at the foot.

The autumn costumes for walking and for ordinary wear are tailor-made, which does not always mean that they pass through tailors' hands, but merely that they have short, fitting bodices, with square, swallow-tailed basques, and skirts either cut with gored breadths or with a new volant. It need scarcely be observed that this latter requires skillful manipulation to be in any way a success, and where a first-rate firm cannot be employed it is better to order the gored skirt, to which, without much danger of mishap, a round beds over in winter or as soon as the ground | volant, cut to its form, can meet it half a is frozen, and then mulch the rows with yard from the foot. Those skirts, however the volants of which are attached to the that have died down are cleared away and tablier and to the upper back breadths are many seeds on the surface of the ground utterly spoiled if not made in a workmanlike manner.

Belts and buckles are special features for Belts and buckles are special features for the purpose increases the number of eggs and the enables the farmer to get a good price for his seed by keeping large numbers of hens. The yield is about 20 bushels per acre, and it can be grown on nearly all kinds of soils.

Belts and buckles are special features for the blouse increases the number of eggs and the blouse and tiny waist. The blouse it self must be tightened at the waist by a firm band, then the belt adjusted without the thought of making the waist any smaller.

The use of such seed for that Belts and buckles are special features for the blouse increases the number of eggs and the blouse and tiny waist. The blouse it self must be tightened at the waist by a firm band, then the belt adjusted without the thought of making the waist any smaller.

THE CENTAUR COMPANY, 77 MURRAY STREET, NEW YORK CITY.

The Hessian Fly in Wheat.

H. T. Fernald, state zoologist, has issued a bulletin on the Hessian fly in wheat which may be obtained by farmers by writing to him at the department of agriculture, Harrisburg. In the bulletin he says there is a tendency in Pennsylvania, as well as elsewhere, for farmers each year to get their sowing done a little earlier than the year before. This is directly favorably to the fly. Wheat sown as late as Sept. 20th will make growth enough so that it will not winter-kill, and this method has been tried in States farther north than Pennsylvania for many months with success.

AN EXPLANATION.—The reason for the great popularity of Hood's Sarsaparilla lies in the fact that this medicine positively cures. It is America's Greatest Medicine, and the American people have an abiding confidence in its merits. They buy and take it for simple as well as serious ailments, confident that it will do them good.

Hood's Pills cure all liver ills. Mailed for 25c. by C. I. Hood & Co., Lowell, Mass.
