Democratic Matchman.

Bellefonte, Pa., August 16, 1901.

## FARM NOTES.

-The fall season is believed to be the best for using lime. Every farmer under-stands that lime gives good results, but the action of lime in the soil differs according to the texture of the soil and the amount of mineral and organic matter contained. Lime keeps the soil sweet by neutralizing acids which arise from the decay of animal and vegetable matter in the soil. Mr. A. Peets, in England, who has done much to attract attention to the use of lime, states attract attention to the use of lime, states that lime, by keeping the soil sweet, en-ables the germs in the soil, both those which convert humus into ammonia and those which convert ammonia into nitric acid, to carry on the work which cannot be done in a sour soil. The carbonic acid be-ing the product of the existence of the bacteria, it is as injurious to the existence of their well being as the impurities of a vituated atmosphere are to the well being of their well being as the impurities of a vitiated atmosphere are to the well being of the high types of animals. When nitric acid is formed by the nitrifying germs in the soil it unites with the lime to form nitrate of lime when otherwise it would be given of into the air. In the same way given off into the air. In the same way lime serves to preserve in the soil the soluble phosphates by converting them into water soluble and citrate soluble phosphates. Also, the potash, by converting it into carbonate of potash; both of which valuable plant foods would be lost, to a certain extent by drainage. A judicious application of lime also destroys many in-sect pests which hibernate in the soil. Lime, in its dry state, is very friable, and serves to disintegrate clay lands in much the same way as burnt earth, thus being of assistance in rendering the soil lighter. LIME AS A PLANT FOOD.

It is claimed that there should be at least one-half per cent. of lime present in any soil, or one part in two bundred. To test for lime put some of the soil in an ordinary tumbler or test tube, pour in a little water and stir well, and then pour in a little mu-riatic acid. If it effervesces freely the soil contains sufficient lime, but if effervescence is feeble, or is not apparent, the soil re-with a diameter of 18.9 inches. The for lime put some of the soil in an ordinary is feeble, or is not apparent, the soil re-quires lime. When lime is applied it should be in a very fine condition, air-slaked, and should be distributed evenly Good Recipes to T by broadcasting over the surface of the soil. The tendency of lime is to go down into the soil ; hence it is not necessary to work it with a harrow. It should not be left in use one-half teaspoonful of salt, a little pepper and one teaspoonful of butter cut into bits. Beat together well and cook as a plain omelet. Chicken Terrapin—Cut up remnants of

## LIME AND GREEN CROPS.

As lime is slow in its effects on most soils the benefits derived from its use may not be apparent for months, for which reason it is broadcasted in the fall so as to allow it is broadcasted in the fall so as to allow as much time as possible for it to remain in the soil, the land being plowed in the spring. It gives excellent results when used with green manurial crops, being used on the plowed ground when the crop is turned under, but as the soil may lose some of its soluble plant food during the winter, if left uncovered, it is the practice with some to sow rye on the plowed land, turning the rye under early in spring. Gas lime is also sometimes used, but being sulphide and sulphurite of lime, and being very different from air-slaked lime, it does not give the same results, and may prove injurious if used in very large quantities. Gas lime does not assist nitrification, and is not therefore, as valuable as may be sup-posed, though it is a powerful insecticide. It is not necessary to apply lime every year. If applied every year the quantity should be small, not exceeding ten bushel per acre, and even then it should not be used every year on the same land except when a green crop is plowed under, the lime then assisting to neutralize the acids in the soil. Lime is not a substitute for not give the same results, and may prove in the soil. Lime is not a substitute for manures or fertilizers ; in fact, if lime is used there is all the more need for manure or fertilizer, as the advantage held by lime over the fertilizer salts is its chemical and mechanical effect on the soil.

Very Long Ranges. The Gun Which Will Hurl a Shot Twenty-one Miles. Over a Very High Mountain. Comparison FF of the Feat Expected of the Sixteen-inch Weapons With the Next Best Record.

Undoubtly the most spectacular feature in connection with the new 10-inch United States sea coast defense gun is it enormous range, which is estimated at 21 miles, or, the theorem is the set of the state of the st range, which is estimated at 21 miles, or, to be exact, 20,918 miles. This theoreti-cal range says a writer in *Cassier's Maga-zine*, has been calculated by Major James M. Ingalis, Fifth United States School for Officers at Fort Monroe, Virginia. A fir-ing table for the gun prepared by the Ma-jor Ingalis show that the above range is obtainable with a muzzle velocity of 2300 per second, with the necessary angle ele-vation of the piece. The trajectory of the projectile shows that in ranging to 28,978 miles the shell would reach the maximum elevation of 30,516 feet. This is enor-mously greater than the maximum range TH TAK mously greater than the maximum range hitherto obtained by any other gun, which, The hitherto obtained by any other gun, which, at present, stands to the credit of a Rrupp 9.45inch gun, fired on the Meppen range, in the presence of the Emperor of Germany in 1892. The measured range was found to be 22,120 yards, or, roughly speaking, 12½ miles. The greatest height reached by the Krupp shell in its flight was 21,456 feet, and the time occupied between the firing of the gun and the striking of the projectile was 70.2 seconds. It was pointed out that had this gun been placed at Pre St. Didier, in the Alps, elevated to 44 degrees and fired, it shells. would have ranged 8956.8 feet higher than Mont Blanc, and its fall would have been in the neigh-YOU THE stud and its fall would have been ih the neighand its fail would have been in the heigh-borhood of Chamounix, on the other side of the range. This performance, great as it was becomes positively insignificant compared with the capabilities of the new United States army gun. With the ex-treme height of trajectory of 30,516 feet or over 55 miles the projectile would in or, over 5<sup>3</sup> miles, the projectile would in its fight, rise higher than the combined heights of Mont Blanc and Pike's Peak, measuring, respectively, 15.779 feet and 14,083 feet. The total length of the gun is 49 feet 3 inches. The diameter of the rear portion is 60 inches, while the forward

## Good Recipes to Try.

Corn Omelet-Cut and scrape the pulp from boiled corn, of which use one-half

Chicken Terrapin-Cut up remnants of cold cooked chicken into small pieces, leaving aside all bone and gristle. Put into the chafing dish one cupful of cream and two tablespoonfuls of butter rubbed smooth in two level tablespoonfuls of flour. Stir until boiling and smooth. Add salt and pepper to season, then add two hard boiled eggs chopped fine and the chicken; when well mixed add two tablespoonfuls of sherry wine. Cook one minute and of sherry wine. Cook one minute and serve hot.

-Of course the methods of protecting dairy cows from flies are manifold. Some advocate a light covering. It should be of burlap or some light material that will not make the cow uncomfortable from the heat. The practical objection is that the covering gets under feet and torn, and is not effective.

fective. In recent years various kinds of oint-ments are used; but they need to be ap-plied frequently. If the cows could be smeared once a day, when going out in the morning, and then left until they come home at night, these applications would be more generally adopted in fly time; but in our own experience it requires two or three applications a day when the flies are very troubleseme.

A third remedy is to keep the dairy cows in darkened barns during the middle of the day in fly time in summer, and allow them to pasture at night. This practice is gaining favor with many dairymen. The cows readily adapt themselves to the changed condition, and the freedom from annoyance by flies will show in considerable increased flow of milk. Remove the windows and tack sacks over on the inside to darken, and at the same time admit plenty of fresh air .- Farm, Field and Friend.

-When the fowls begin to moult they -When the fowls begin to moult they will require about three months in order to produce new feathers, but the time for moulting may be reduced by feeding oily food, such as sunflower seed, oil cake or linseed meal. First put the hens on a low diet, giving little or no food except lean meat, so as to reduce them in flesh, and then begin with the city food which will meat, so as to reduce them in flesh, and then begin with the oily food, which will cause them to drop their feathers rapidly. To produce feathers (the news ones) they should be fed ground bone, lean meat and also a little sulphur daily, allowing but a small quantity of oily food after the old feathers are thrown off. During the warm season little or no grain should be given. Feathers consist largely of the nitrogenous elements and also contain considerable sul-phur, hence the food need not be of a kind that is fattening. that is fattening.

-Quality in poultry is important, and but few understand that it is difficult to judge the quality of a fowl by the color of its legs. The yellow legs and skin on a fowl do not in any manner indicate quality of flesh. On the contrary, the best table fowls are those that have dark or flesh col-cad level such as the Dorking Langshan. ored legs, such as the Dorking Langshan, Houdan or Pit Game. The best birds are those that have the most breast meat. If those that have the most breast meat. If farmers will endeavor to produce choice fowls for market or for their own use by keeping the breeds for that purpose, they will find a difference in quality and better prices for customers. Breeds that produce choice carcasses are not the best layers al-ways, but they are not very much below the breeds that rank as layers.

NORMAL SCHOOL heat. ASTOUNDED THE EDITOR.-Editor S. A. ASTOUNDED THE EDITOR.—Editor S. A. Brown, of Bennettsville, S. C., was once immensely surprised. "Through long suffering from dyspepsia," he writes, "my wife was greatly run down. She had no strength or vigor and suffered great dis-tress from her stomach, but she tried Elec-tric Ritters which helped her et once, and

tric Bitters which helped her at once, and, after using four bottles, she is entirely well. It's a grand tonic, and its gentle laxative qualities are splendid for torpid liver." For indigestion, loss of appetite, stomach and liver troubles it's a positive granteed area. Only 50% of positive, guaranteed cure. Only 50c at Green's.

## A Physician on Buttermilk.

A Physician on Buttermilk. The virtues of that old-fashioned and easily procured drink, buttermilk, have not half been sung, says a well-known physician. It is an actual fact that its lactic acid is even more healthful than the citric acids of oranges and lemous. It is credited, too, by those who should know, with being of value to a rheumatic patient. It has been found to be both nourishing and fattening, as well as remarkably easy of assimilation. If liked at all, it is un-doubtedly a better drink in summer than many of the carbonated, artificially drinks that are consumed in almost unlimited quantities. quantities.
