FARM NOTES.

-Lima beans may require watering if the season is dry, but it pays to do so, as the crop is a valuable one, and easy to cultivate after the poles are set. The soil for Lima beans should not only be rich, but kept clean. Crops may be put in this month for a late supply.

—In Canada they begin at the beginning in the eradication of weeds. Dr. Fletcher tells that in the schools of Manitoba the children are taught to know and name the thirty commonest weeds on their fathers' farms and tell whether they are yearly, two years or many year plants.

-String beans can be grown as long as the weather is warm. The practice of growing the earlier kinds alone is too general, for a ready sale awaits them whenever they reach the markets. Try some of the late varieties, and keep up a succession as long as the opportunity permits.

-The pigs should be turned on grass as soon as they are weaned and the grass is ready. They will then require no feeding, except a mess of ground oats mixed with middlings, which should be given at night. Corn is too heating for the pigs during the summer season, and will do more injury than becast. than benefit. Plenty of grass, with an abundant supply of fresh water, is the best food from now until fall.

-A handy arrangement for feeding soft food or marshes is described herewith. Two boards are nailed together, and one is hinged to the wall about one foot from the floor. A bracket is fastened to the wall for the trough to rest on when in use. A two-inch strip is nailed at the front edge of the board to keep the food from rolling off. After the fowls eat, the trough can be hooked up out of the way, and in this way kept perfectly clean, and cleanliness is a great feature in successful poultry raising. -John Rowe, in Farm and Home.

Lime is in general use as a fertilizer, and to a limited extent, also, as an insecticide. Testimony as to its value is conflicting, and this is due to its condition when applied. Lime as an insecticide ought to be in the form of a dry hydrate. To shell lime or limestone just enough water is to be added to slake; then sift through a moderately fine sieve and dust on the insects when they are wet. Only soft-bodied in-sects can be reached by this substance, and A severely simple little frock that will readily incorporate itself with the liquid, the application must be made so that the caustic properties of the lime may have a chance. The larvae of the potato beetle made of gossamar-like batiste, the full and asparagus beetle are good subjects, and he testimony of its effectiveness on the abbage worm is not wanting.

dition of farm buildings is a most important one. Dwellers in the country are obliged to depend upon themselves almost obliged to depend upon themselves almost entirely for securing healthful surroundings, as they do not have the advantage of boards of health and the sanitary regulations of the city. I would particularly emphasize the importance of care in regard to the source of drinking water. See that no sink sponts or vaults can possibly con-taminate the wells or spring. If the water can be brought in a constant stream from some pure spring in the fields, far away from all the buildings there will be little danger of its containing the germs of typhoid fever or other diseases. should always be a drain from the sink to some point, at a distance from the house. In vaults and outhouses, plenty of lime and other disinfections should be used.

—Almost every boy knows how to whit-tle, but I have found very few men who without special training could trim sheep's feet speedily. To do so a pair of toe cut-ters or pruning shears and a good jack-knife with a narrow blade are necessary. If the hoofs are long enough to make it necessary, use the cutters first, always cutting from the inner side and sole of the hoof. Cut in a plane about parallel to that of the attachment of the hoof. The hoof outs easier in this way and there is far less danger of cutting too short. A lit-tle practice will enable one to turn the cutters in the hand with almost no loss of time. To do it drop them against the sheep, turning them as dropped. Two strokes with the knife on each hoof should out the foot in good shape. Always start the knife at the cleft of the heel. The first stroke should remove the outer wall, the knife being moved in the plane of the sole of the foot. The next should remove the inner wall and be drawn at an angle of forty-five degrees to the sole.—H. P. Mil. ler in Ohio Farmer.

—Every swine raiser probably has his own ideas about the proper time for the pigs to be littered, and there is no doubt that the different localities and the accommodations for their reception which have been provided make a difference as to the best season for them to come. If good shelter and comfortable houses for the brood sow have been provided, there is no doubt that the pig farrowed in February or March will be a profitable piece of proper-ty, but without these they had better come later. If the breeder follows the practice of raising two litters a year, as many of them do, early farrowing is a necessity. A pig that makes its appearance from the middle of Febuary to the latter part of March can be so managed that the second litter can come and be well on the way before the cold weather sets in. A pig which comes early in the season has the advantage of grass, and he will thrive, come to maturity and become fat at much less expense than one which is farrowed in the fall.

Another advantage is that pigs born in the early months of the year can be fatten-ed and sent to market before the hogs which have been fed on the new corn are sent in to glut the market and cause a depreciation in prices. In addition to having warm shelter, the brood sow should have more than ordinary care when she is expected to bring forth her litter while the cold weather is still in evidence. During the period of gestation they should not be good feed for sows at this time is potatoes, boiled and mashed and mixed with ground oats and corn, with the addition of a small quantity of bran. The small potatoes which have been sorted out from the marketable ones can be utilized very profitably in this manner. Scalded clover hay is also a good addition to the slop, as is also all the skim milk that can be spared from the kitchen.-Chicago Drovers' Journal.

FOR AND ABOUT WOMEN.

Golden eagles are embroidered on the shield cuffs and the upper part of the sleeves of a Russian blouse suit of white mohair. This is for a small boy.

If the girl who is going away on a short vacation can have but one shirt-waist suit she will be wise to have it made of wash silk, for she can wear a silk gown on many occasions, even if it is made in shirt-waist style, when a linen or crash dress would be bad form. A good be bad form. A good model to copy is made of ecru wash silk; the gored skirt is light and cool; it is made very plain and unlined. It is close fitting, with no fullness until below the knees, where a box-pleat is inserted at each gore, the box-pleat headed with a stitched diamond-shaped

piece of silk.

The shirtwaist is made without the exaggerated blouse, and shows the pretty lines of the new French curve figure, pro-duced by the new Rosalind skirt-holder, which makes the long, slender waistline so much to be dssired. The waist has a boxpleat down the front, with a group of nar-row pleats at either side. It is trimmed with narrow white silk braid to simulate a yoke, and on the box-pleats. arranged in two groups, are big pearl buttons. This dress is not at all inappropriate for morning wear, and yet it is equally good style for almost any informal afternoon occa-

In making up a gown of this sort, where the skirt is of light-weight silk, unlined, the petticoat requires special attention. It making up a gown of this sort, where be omitted, for the reason that acids appear to intensify the trouble.

Milk heads the list in the way of fluid the petticoat requires special attention. It must be fitted over the hips as carefully as the dress skirt. There must be positively no fullness at the waistline, while at the bottom there may be one deep flounce, slightly stiffened with featherbone, or many featherboned stiffened ruffles.

Of course, she must have a smart looking of course, she must have a smart looking traveling dress, and for this no material is better suited than dark blue mobair. A plain skirt and a collarless Eton coat is good style for such a costume. If the suit was made solely for traveling, it should be severely plain, but as the girl with two weeks' vacation will need to wear it on many other occasions, it should be trimmed in some effective way.

sent this best of foods; she can heat it, or offer it cold, or in the form of cocoa; or she may have cooked in it peas or any other adventues to impart to it a desired flavor. As junket requires no mastication, it may be appreciated once in a while.

The food value of any preparation is greatly enhanced by the addition of an many other occasions, it should be trimmed in some effective way. in some effective way

An effective trimming is to have the col-An effective trimming is to have the collarless Eton finished at the neck with alternate bands of taffeta silk and cream lace insertion, and to have these same silk and lace bands form tab eqaulettes over the shoulders and tab ends in front. The cuff of the sleeve may also have a touch of taffeta and lace. Of course, this Eton is a separate jacket and may be worn, if necessary, with separate skirts. sary, with separate skirts.

skirt fitted by means of vertical tucks and trimmed with horizontal tucks at the bottom. The bodice shows a high white ribtom. The bodice shows a high white rib-bon girdle, over which falls a closed bolero -The whole subject of the sanitary con- trimmed with tucking. At the throat the blouse is cut away in a small point and trimmed with an exquisite shoulder collar case of liquids, for the reason that the diof embroidered batiste, this wonderful bit gestive economy no less than the patient's of hand work relieving the frock from plain-

Another frock that is being made for a girl in the same class is almost as simple. though intended for the wear of an exceedingly rich young woman. It is made of French mull, and has a doublepleated blouse and skirt, bands of Teneriff medallons forming belt and sleeve trimmings, outlining the blouse yoke and heading the deep flounce with which the skirt is faced.

Another frock that is being made for a girl in the same class is almost as simple, though intended for the wear of an exceedingly rich young woman. It is made by combining a tablespoon of malted milk with two teaspoons of condensed milk, along with a pinch of salt, sugar to taste, and sufficient hot water to fill the cup.

For saving the child any undue pain bent glass tubes ought to be provided for bent glass tubes ought to be provided for use necessitates opening the month but

allowed in the skirts; and as one must not look "hunchy," this fullness is gathered onto perfectly fitted plain hip yokes, which are frequently cut in one with the front breadths. Onto this yoke the gathers are sewn, and again held by one, two or three bands lower down, which secure the skirt in the required shape. The fullness skirt in the required shape. The fullness is allowed to fall free from just above the knees at the back, and below the knees in front, the hem being trimmed in some way, either by tucks, insertions of lace or fancy stitchings. The corsage, of course, shows gatherings in some way, but the new idea is prominently developed in the sleeves, which are cut half as long again as required, and drawn up by a band of shirrings from one to two inches wide, on the inner side of the arm being made decention. ed, and drawn up by a band of shirrings from one to two inches wide, on the inner side of the arm, being made decorative, to match the hem. These sleeves are gathered into closely fitting cuffs or bands. This treatment is varied by allowing the sleeve reatment is varied by allowing the sleeve to fall in a wide bell, in which case the join is hidden by the shirrings; and quite often the bell veils a long, closely fitting under sleeve of lace, that falls over the hand liks a mitten. (Mittens of lace, and silk natted gloves are even more worn than the first symptoms, or at least for two silk netted gloves, are even more worn than last summer.)

The Parisian tailor gowns are always more elaborated than the London styles; and are for that reason much more useful; as the style and cut are simple enough to as the style and cut are simple enough to make them suitable for morning or shopping wear, while the dainty touches of trimming give them a becoming softness that makes them correct at any time of day. That is why American women prefer the Parisian models to those of the more severe London styles. Coats are getting longer in the skirts, if fitted to the figure, but the smart little coat with or without a but the smart little coat with or without a short basque, is and will remain in favor, as also the short loose coat. Coats of all kinds are much trimmed with lace, braids, cords and pendants. Double and triple capes are all very light, for in these days the only use of a coat is to carry for chill night protection, or, as in the case of the Pongee, alpaca or linen coats, to protect one from the dust on a long country drive.

Where linings are necessary, they are of the lighter silk, or even of chiffon. The sleeves are full and large, of course, but as the dress sleeves are more moderate, so also are the coat sleeves de-

pected to bring forth her litter while the cold weather is still in evidence. During the period of gestation they should not be kept fat enough to make good pork, but at the same time they should be kept in good condition. Their food should not consist exclusively of corn, but should be varied with a diet that will produce bone and muscle as well as fat and warmth. A good feed for sows at this time is potatoes, inch panel border without fullness to form a complete panel and when they are drawn open the entire scene is shown.

> Little girls in short frocks wear their sashes tied very high up on the waist; this is quite a charge from the belt line of the Russian blouse, which is absurdly low, almost down to the knees. The younger the child the higher up its sash is tied, the short-waisted effect being preferred by the elect.
>
> It is only after the most severe attacks that marks are left, and then the disfigurement is likely to appear upon the face.

Health.

Nursing in Mumps and Chicken-pox.

These two complaints-mumps and chicken-pox—are reckoned among the less serious maladies of childhood; but that the former entails much discomfort, to say nothing of actual misery, is a fact to the truth of which many a little sufferer could

It is asserted that infants are almost exempt from mumps, and that the period of life to which either sex exhibits the greatest susceptibility to the poison of contagion exists between the fourth and fourteenth years. Girls are less likely to be attacked than boys.

Among the initial symptoms that may manifest themselves in the more severe types of the complaint are headache, pains in the back and limbs, chilly feelings, fever, vomiting, and a consequent loss of appetite. The little one complains of pain in the region of the ear in about two or three days thereafter, and this is soon followed by a pronounced swelling of the parts. As the misery of the child is greatly augmented by swallowing or any attempt to open the mouth, it is obvious that nourishment should be administered with a view to causing as little discomfort as may be. While the diet must be as nourishing as possible, it ought to be restricted to liquids, on account of the increase of pain which mastication would involve. Any foods or drinks containing acids should

nourishment, and the intelligent mother or nurse is apt to think of this first, therefore; but to serve it in just the same form too frequently would necessarily occasion disgust for it. The inventive care-taker will think of a variety of ways in which to pre-sent this best of foods; she can heat it, or

petizing concoction may be evolved by pouring half a tumbler of milk in a preoughly blend the ingredients. If the white of an egg be beaten before adding, it will not lent adjunct to the dietary. One cannot be provided with too long a list of articles very nutritious drink, and one that was

for some time before its ejection. Envelop the neck in raw cotton to pro-

from the first symptoms, or at least for two weeks after disappearance of the swelling. While reckoned among the childish com-

plaints, mumps is not entirely confined to children, as cases do occur among adults. Though a contagious malady, the disease in question is not nearly so much so as any other of the communicable complaints, and is not a serious one ordinarily. Recovery takes place in less than a week in the great majority of instances. Evil complications, when they do occur, are more likely to manifest themselves after the twelfth year, and to involve the sexual organs.

The little one should be confined to bed should the ailment appear to affect the general health, and under such circumstances medical intervention is especially enjoined. Upon recovery from an attack of mumps it is not considered necessary to disinfect the patient or his wearing apparel, nor to disinfect the room.

CHICKEN-POX. Serious consequences are indeed rare as concerns an attack of chicken-pox, it being regarded as a very trivial complaint. At the same time it is highly contagious.

In the majority of cases the major presents such mild disturbances of the general could be a to receive the need for treat-

void of extravagance now; and there is a health as to preclude the need for treat-tendency to further reduction in size as the purgative to secure free movements of the

> To overcome the annoyance consequent To overcome the annoyance consequent upon itching it is a good plan to dust the skin with a good talcum or other powder, or to anoint it with one of the preparations of petroleum, like vaseline. After crusts have formed it is better to employ an ointment containing two per cent of ichthyol.
>
> As cleanliness is important in any illness, the body will require frequent bathing. Moreover, proper care of the skin ing. Moreover, proper care of the skin will prevent the child's making too free use of his nails. Scratching is apt to ag-gravate the rash, and to result in poisoning of the skin.
