Thin Apples in June to Get Quality Fruit.

The best time to thin apples in Centre county is just after the June drop, which may vary in different years but usually comes from June 1 to 25. Apples at this time are about an inch in diameter.

If fruits are thinned during this period the fruit will reach the higher color and better size because the trees can use the food over a longer period of time to develop the fruit that remains.

In thinning remove the small green and knotty apples hanging under side of the trees, the insect eaten and diseased and the injured fruit. Reduce the clusters of fruit to one apple. This assists in the fight against cod-

ling moth. Shaking should never be used as a means of thinning as the wrong fruit is likely to fall. Thinning may be done by hand or with a pair of thinning clips. We have found that if a little care is taken in removing the fruit by hand no spurs will be broken off and the operation will be accomplished just as fast. Raise the fruit and give it a slight twist to break back the stem. On long stem varieties grasp the stem between the thumb and first finger, with the apples in the palm. A slight pressure of the second and third fingers pulls the apples off the stem.

All varieties cannot be handled the same way, and conditions vary with the size of the trees and cultural practice. In the case of certain varieties with light crops, fertile soil and vigorous trees, thinning will not be needed.

If pruning has been done properly the larger varieties, such as Rome Beauty, Delicious, Winter Banana, Ben Davis, Baldwin, Spitzenberg, York

Imperial, Rhode Island Greening and Northern Spy should be thinned from 8 to 10 inches. Smaller varieties, Winesap, Jonathan, Grimes, Golden and others, should be spaced 6 to 8

inches apart. Varieties like the Jonathan and Winesap as they get older tend to get smaller and vigorous thinning is essential if size is to be maintained.
