

(From the Country Genntleme.)

DIFFERENCES IN SOILS.

are produced. The component parts are argil, sand, water, and air. Argil is the soft and unctious part of clay. Argil and sand contains each, in nearly second downward and contains the soft and contains the soft and contains each, in nearly second downward and contains the soft and con each, in nearly equal degrees, the food of plants There are different kinds of soil, which may be divided into four classes, namely; clay, sand, gravel, and what is termed peat earth. There French muslins—&c., &c. is, however another kind of soil called garden mol i, but, as it is mainly of artificial creation, i can hardly be ranked withmatural or original soils. Loam, too, has been considered by some as an original earth, but in reality it is an artificial soil, propuced by calcareous matters, and vegetable manures. In process of time the strongest clay may be converted into a loam by repeated applications of the substance just mentioned. Sandy soils may also be converted into light leams by the application of lime, chalk, marl and clay. And even peat may be turned into a black, soft loam, and rendered fertile and productive.

A clay soil differs from all other soils, and is tough, wet and cold, and requires a good deal of labor to render it fit for bearing artificial ecops of corn or grass. When once wetted it does not soon dry, and when thoroughly dry it is not easily wetted. When it is plowed in a wet state it sticks to the plow like mortar, and REED & MINNICH'S STORE. is not easily wetted. When it is plowed in a in a dry summer the clods can scarcely be broken or seperated by the heaviest roller.

trouble, and at an expense greatly inferior to what clay soils require; but the crops which ar : produced from them are generally of smaller value. There are several varieties of sandy soils, and in some artificial plants will not thrive unless a portion of good earth is previously mixed. A true sandy loam resting upon a sound subsoil, is called the most valuable of all soils upon which all kinds of grain may be raised with advantage, and no soil is better adapted for turnips or grass. Sandy soils thoroughly invigorated with clay and marl, by judicious management, may be made to produce the largest crops.

Gravelly soils freely imbibe moisture, and lightness of their texture, they are neither expensive nor difficult in the means of cultivation. They are usually barren, but by frequent applications of manure, and by frequent returns of grass, they may be made fertile and prolific. Deep plowing is essentially necessary, so that the surface soil may be augmented, and greater room given to the growth of the plants cultivated on them. If shallow plowed, it is either burned up in a day or two of drought, or equally injured by an excessive fall of rain.

ophers, however, disagree on this point. By one it is called a primitive earth; by another, a vegetable which grows and increases, and continues to increase until it destroys all other soils; and by a third, that it consits of ligneous and aquatic plants. It has been said that onefourth of the habitable globe is peat, or moss earth, and it is, perhaps, surprising that so little is known on a subject of so much importance. The soil is friendly to growth of oats, if previously it has been summer-fallowed and enriched with manure. A heavy crop of wheat if the season is favorable, may also be obtain-

As to the use to which soils may be most advantageously applied, it is requisite that clay soil be kept rich and full of manure, which qualifies it for carrying crops of wheat, oats, beans, and clover. Usually, clay soils require great industry and carc, and a thoro' knowledge in the dressing, to keep them in a proper condition. No soil is so ungrateful as this one if allowed to get into a sterile condition; but if manure is profusely appropriated, with an oc. casional summer-fallowing, it will yield the heaviest and most abundant crops.

Upon light soils the case is somewhat different. The facility with which they are cultivated, furnishes encouragement to keep them under the plow. Grasses flourish the best, and summer fallow is rarely required. The best method, perhaps, of procuring wheat is to sow upon a clover stubble, which gives an artificial solidity to the soil, and is thereby rendered capable of sustaining this grain until it arrives King & Co.
