Winter Management of Bees.

A correspondent to the American Bee Journal, writing from Battle Ground, Ind., furnishes that paper with the following useful hints :

It is usual for the apiarist to look after his colonies of bees and see that each one is in good condition for wintering. We will suggest, as a rule that from Nov. 1 to the middle of December is a good time to look after the bees, and see that they have a sufficiency of honey to last them through the winter. Perhaps in some seasons it should be attended to earlier. A good colony of bees should have at least 15 to 20 pounds of honey stored

in the combs. It is now a mooted question as to whether it is advisa ble for a colony to possess a very ble for a colony to possess a very great quantity of pollen in their winter trician of Westfield, N Y., to our restores.

It has been asserted, w think very justly, too, by some who profess to be well versed in the science of apicultury, that pollen is the true cause of much disease among bees during the winter months, and especially very early in the spring do we often hear of complaints about the bees having diacrheea. As a remedy for this trouble, we further suggest that salt water be placed in wooden troughs and set within a few yards of the bees, and then we think there will be but little risk to run in bees keeping perfectly healthy, if all other things are in proper condition, such as ventilation, good, pure food, and a comfortable shed, which should always be provided for them by the bee keeper. The shed should have an eastern front, but if it cannot be thus made, our next choice would be a south front. All bee sheds should have a close-fitting back and well-shingled risk in handling wires ?"

roof. If these suggestions are attended to at the right time, and prepared with a due regard to comfort for the bees as any other stock on the farm, we would have no cause for complaint. A good farmer never thinks that he has done too much for his horses, cows, sheep and hogs, by building good barns, stables and pens, in which he can have all his farm stock protected from inclement weather.

The question has often been asked. "Is it necessary to build good winter quarters for bees ?" We answer that esting several times." it is just as essential as it is for any other stock. It is true that we do not pay as much for a colony of bees as we do for a cow or a horse ; but it is no less the duty of the husbandman to protect and care for the bees by proiding the proper sheds for them, when they "board themselves," and often return a large surplus of hon-

Winter Care of Fowls.

For keeping fowls through the winter the chief and most essential thing is a warm hen house. It should be built so as to afford as much sunlight as possible and at the same time give protection from frosts and cold winds. A southern exposure is, of course, in all cases the best. Where fowls have all cases the best. Where fowls have no special quarters assigned them, as is trated me. It was a uremic convulthe case on many farms, they should at sion. For all my physicians told me I least have a dry and warm shelter for was a victim of a very serious kidney the night. If they have a house of disorder. And when they and a dozen their own they should be provided in widely advertised medicines failed to
