#### Division of a Fraction by a Fraction.

In a former communication I reported the favorite method of local institute instructors who illustrate the principle of dividing a fraction by a fraction in the following manner-" 1 go at a price that will close them chosen for illustration is, "divide \( \frac{2}{3} \) quickly.

Chosen for illustration is, "divide \( \frac{2}{3} \) and \( \frac{2}{3} \) in the second of the se ceptions to the above method of illustration; but obtained the same result by another process, or method, viz: eight-ninths is the result of 3 divided by 3.

At this point all the local institute instructors have stopped, and left the most important point unexplained and developed, viz: Why is the value of a fraction greater after division, than it was before division? For example, possible "that a number is contained in another smaller than itself." I like X's illustration; but let all institute instructors tell us, how, and why, the value of a fraction by division creased, instead of diminished, as black and colors, \$4.98. Gidding & the inference is, and as children are all the judges on the bench. taught, that division means smaller
