

SELF-FEEDER FOR HOGS.

The Diagram Explains Better Thap Words Could the Way It Is Put Together,

But little need be said in describing th self-feeder here illustrated. It is built of inch lumber and the sides are six feet high. The roof is made watertight and should have a coat or two of paint, especially in the joints. It should be set on locust, oak or stone sills for the sake of durability. The

feeder can be made as long as wanted and at each end of the trough a board should be nailed on to prevent the corn being pushed out on the ground. -Orange Judd Farmer.

FAIR PROFIT IN PORK.

flogs Will Command a Reasonably High Price for Some Lattle Time to Come.

Prices in the hog market have been what may be called "firm" for a good many months. That they are to re-main so is indicated to some extent main so is indicated to some extent by the anxiety shown by the packers who are doing all possible to stimulate hog raising. The recent high prices have resulted in the marketing of a good many light hogs. In some of the Chicago markets a good many light pork loins are being sold, some of the loins weighing about five pounds each, less than half the usual. The pigs were evidently marketed because their owners feared a drop in prices, but this very process is most likely to prevent a drop in prices, but this very process is most likely to the supply of mature hogs. We do not mean to say that the prices are to stay at the present point. That would be absurd. The market must and will change in response to the multiudious change in response to the multitudious influences that are always affecting it. But the prices of hogs will for a long time at least remain high enough to permit of the wise feeder and judicious marketer making a profit on his investment as well as to get pay for his work. There are few farmers that raise too many hogs. It is more usual for him not to raise as many hogs as would yield him a profit. The men that have been raising hogs for years and have kept at it through bad times and good are now making money out of their te-nacity. There is money in pork, but the farmer that goes into hog raising in good times and out of hog raising in bad times is likely to miss it .- Farmers' Review.

HINTS FOR THE STABLE.

Never use musty or dirty litter.

Whitewash the stable once or twice a year; use land plaster in the manure gutters daily.

Use no dry, dusty feed just previous to milking; if fodder is dusty, sprinkle it before it is fed.

Clean and thoroughly air the stable milking; in hot weather before sprinkle the floor.

Stables should be well ventilated, lighted and drained; should have tight floors and walls and be plainly constructed.

Keep dairy cattle in a room or building by themselves. It is preferable to have no cellar below and no storage horses to pasture. He is obliged to

CORN STALK DISEASE. Caused by Pasturing Cattle in Stalk

Fields Late in Fall or Early in Winter,

This term is applied to a disease occasioned by pasturing cattle in stalk fields late in fall or early winter. An outbreak, if one should occur, usually takes place in from two to fourteen days after the animals are turned upon days after the animals are turned upon the stalks. The great majority of cases occur between the fifth and eighth days. It is also observed that all animals affected die within two or three days of each other. There is nothing in the appearance of the fod-der to indicate that it may cause trouble. Cattle may graze and do well on one field, and from ten to fifty per cent, be lost on another separaied only

cent. be lost on another separated only by a fence. It makes no difference whether the cattle are allowed to graze for only a few hours or left in all day. After one outbreak has occurred a second rarely follows. The disease has never been reported from feeding cut fodder, even when taken from the same field as that in which disease has occurred from grazing. The cause has never been determined, but it is most often observed after a dry season.

The general symptoms are that the animal appears dull, persists in stand-ing in one place, or if he moves it is with a noticeably jerky gait. There is with a noticeably jerky gait. There is marked prostration; the animal will fall on the knees, and may require sev-eral attempts to rise. Some act as if crazy, but the majority are stupid. There is more or less frothing at the mouth, and almost constant swinging of the head from side to side whether is the cradience it is a king down in the standing position or lying down. The movements are indicative of pain. The course is of very short duration, from two to thirty hours, the majority living less than six hours. Too often the history is that the eattle were all right in the evening, and from one to eight found dead in the morning. As the cause is not known, and a successful treatment has not been discovered, the prevention cannot be prescribed except by using cut fodder. In a numof outbreaks of supposed blackleg, Dr. Craig, assistant state veteri-narian of Indiana, has found this to be present instead. The disease is not contagious and cannot be spread from one to another. The occurrence of afew cases in a community should not frighten others to discard the use of the stalk field for feeding .- Agricultural Epitomist.

MOVABLE WATERING TUB.

Up-to-Date Device That Will Last for Years and Can Be Used for Many Purposes,

The accompanying cut shows a very convenient trough for watering or feeding cattle in the barn. It can be any size desired, but the most made serviceable size is about 4x11/2 feet. The sides should be built slanting as shown, for then it is easy for the stock to eat out of it, and it can also be more

readily cleaned. It is also covenient to water eattle with in winter. Provided the mangers are composed of nothing more complicated than the bare floor, as I have seen in many barns, the trough, filled with water, can be rolled in front of the cows, and from one cow to another. Where running water is available, it can be let run into the tub and speedily rolled to the animals. With wheels made of hard wood, the device will last for years, and, aside from watering the stock, can be used for a variety of other purposes about the barn, saving labor and adding to the profit .- Fred. O. Sibley, in Ohio Farmer.

Every trial shows . better returns when wheat is mixed with some other grain than when fed alone, although if prices permit it wheat may profitably form four-fifths of a grain ration. Mix-ing with other grainh overcomes the tendency to form a pasty mess.-Farmers' Review.

How to Have Strong Colts.

One reason why more good horses are not produced in this country is that the dams are not well fed when carrying their foals. If a mare is not workshe is not fed enough strengthening feed to keep her vitality high and produce a husky colt. It takes feed to nake good animals, and it takes feed fore they are born to make them, use feeding heavily after the foal nes if it is a born weakling, with uckling or weak joints and flabby scies. The time to make foals ng is before they come, and then r dams will have plenty of milk the foal will have the ability to and use it .-- National Stockman.

Keep the Sheep Undisturbed.

No calves, hogs, colts or other stock ould be allowed to run with the leep flock, or in any way annoy or scare them, when in their lot at night, or even anywhere, says the New York Farmer. A shepherd dog with which they are every day familiar may be allowed among them, but all other dogs should be prevented from crossing their small inclosures, or even pastures, especially during their breeding or gestation periols. Quiet, gentle and familiar handling of the flock of ewes and rams will have a good influence on habits of the coming flocks of lambs.

exercise as he picks his living, said Dr. W. C. Fair, before the American Veterinary Medical association. Another mistake is the exercising of trotting and running horses on race tracks thus preventing them from making sat-isfactory progress toward recovery. By exercising a lame horse we retard his recovery, and frequently produce atrophy of the healthy muscles in the same limb. If hard pulling or fast driving causes lameness, why not remove the cause and give him absolute rest? That is the very reason why so many track horses never fully recover. They are not allowed to rest after meeting with an injury. True, exer-cise will develop muscles, tendons and ligaments, provided the animal be not lame and weak in any one quarter.

The Easiest to Advance.

There is one point in favor of the man who feeds sheep and lambs this winter—his stock is cheap to start with. It is hard to advance the price with. It is hard to advance the price of cattle and hogs when they sell around \$6 per hundred weight, much harder than to put a dollar per hun-dred weight onto the price of stock that starts at \$3.50 per hundred weight. The prospects are that fat sheep and lambs will show more ad-vance per hundred weight than cattle or hogs. But whether they will make more money is a question. Fat sheep are not much above the price of feedare not much above the price of feed-ers, whereas fat cattle are considerably above the price of feeders .- National Stockman.

Allow no strong smelling material in the stable for any length of time. Store the manure under cover outside the cow stable and remove it to a distance as often as practicable.
