-----ANIMAL WONDERS.

In each grain of sand there are marvels, in every drop of water, a world In that great spectacle called Nature, every being has its marked place and distinct role; and in that grand drama Ebensburg House Furnishing STORE monious as that which rules the movements of the stars. Each hour removes by death myriads of existences, and each hour produces legions of new lives. The highest as well as the lowest created organism consumes carbon and water to support life and its duties. and it is not uninteresting to glance at the food, the limbits, and the ways and means peculiar to some of the inferior animals. From their petrified ejections we know what fossiled reptiles as the plesiosaurus, etc., are, and may some day be able to discover the fish and crustaca they hunted down. Animals, when not living by their own respectable efforts, are either parasites or dependents; many would seem to have positive trades, or are connected with branches of industry. There are miners, masons, carpenters, paper mairufacturers and weavers, lacemakers even, all working first for themselves. and next to propogate their kind. The miners dig into the earth, form natural archesand supports, remove the useless Harness and Saddlery Ware soil: such as the mole, the chinehills of Peru, the badger, the Hon-aut, as | WOOD and WILLOW WARE well as certain worms and molusks. The masons build hats and places according to all the rules of architecture, as the bees and tropical ants. There are fish that construct boats that the waves never can upset, and Agassiz has drawn attention to a fish which builds its nest on the floating seaweed in the middle of the ocean, and deposits therein its eggs. The wasps of South America fabricate a sort of paper or pasteboard. Spiders are weavers as well as lacemakers; one species constructs a living bell, a palace of lace. When the astronomer has need of the most delicate thread for his telescope. he applies to a tiny spider. When the naturalist desires to test his microscope. he selects a certain shell of a sea insect, so small that several millions of them in the water could not be visible to the naked eye, and yet no microscope has TIN, COPPER & SHEET-IRON WARE vet been made sufficiently powerful to reveal the beautiful variagated designs on the atomaic shells! Aristotle remarked, and he has since been corroborated, that a variety of plover enters the erocodile's mouth, picks the remnants of food off the animal's tongue ing toothpick is not mobile. The Mexican owl, while enjoying a riesta. sons of the most robust as the most debilitated health. They are at home in the muscles, in the heart, in the ventricles of the brain, in the ball of the eye. They are generally in the form of a leaf or a ribbon, and are not necessarily, as was once supposed, confined to a special animal. The parasites of fish have been detected living in the intestines of birds; and there are NOTIONS, GROCERIES, some that for the purpose of development, must pass into the economy of a second animal.

FREAK OF AN APPLE TREE .- Doubts are entertained by some pomologists as regards the truth of the statement made that apples have been grown in which two or more varieties were blended into one, that is apples having one section sweet and the other sour. The Boston Journal of Chemistry says: We have seen such fruit and therefore know that it has been produced. A tree bearing apples of this nature formerly stood in a gentleman's garden in Georgetown, Mass. It was of large size, and in some years produced several bushels of fruit.

The owner sold the apples as curiosities, and frequently individual specimens brought large prices. It was exceedingly interesting to examine the crop, as one apple differed widely from finding two precisely alike. A few were found in which almost exactly Dry Goods, Dress Goods, Hats and Caps one-half was sweet and the other sour. But a majority were made up differentteenth, more or less, would be sweet or sour, and the remainder would be of the opposite kind.

The line of demarcation on the skin was clearly defined, the sour portion having a reddish color, while the sweet was of a pale green. There was no mistaking the flavor; the sour portion was very sour, and the sweet very sweet. On the same tree apples grew which were uniform in kind, some being entirely sweet, and others being entirely sout. This pomological freak was brought about by a careful process. of budding, two buds of different varieties being divided and one-half of each joined together, so as to adhere and grow in that condition. As none of this fruit has been seen of late years, we conclude the tree has perished.

Horse-Radish sauce is a great improvement upon the plainly scraped or grated horse-radish for eating with either hot or cold roast beef. A dessert-spoonful of olive oil or cream, same quantity of powdered mustard, a tail tablespoonful of vinegar, and two tablespoonsful of scraped horse-radish, with a little salt to taste, must be stirred and beaten up together, until thor-

AGRICULTURAL.

FIXED PRINCIPLES IN AGRICULTURE. - All lands on which clover or the grasses are grown, must either have lime and every other inorganic const ment which may be found in the ashes of the clover if burned, or those minerals must be artificially supplied. All permanent improvement of lands must look to lime, potash, and other constituents common to plants, as its basis. Lands which have been long in cultivation, will be benefitted by applications of phosphate of lime, treated with sulphuric acid, so as to render it a soluable phosphate; supplied in the form of bone-dust, composts of fish, guano, ashes and oysteshell lime.

All highly concentrated animal manures are increased in value, and their benefits prolonged by admixture with plaster, salt, or pulverized charcoal. Deep plowing greatly improves the productive powers of every variety of soil, that is not wet, though the depth should be increased gradually. Sub-soiling sound land, that is, land that is not wet, is eminently conducive to increased production. All wet land should be drained, and especially such land as has a heavy clay sub-soil. All grain crops should be harvested before the grain is thoroughly ripe. Clover as well as the other grasses intended for hav, should be moved when in bloom. Sandy land can be most effectually improved by the addition of clay. When such lands require liming or marling, the lime or marl is most beneficially applied when made into compost with clay. In slacking lime, salt brine is bother than water.

The grinding of grain to be fed to stock, and mixing it with out hay or straw, operates as a saving of at least twenty-five per cent. Draining of wet lands and marshes adds to their value, by causing them to produce earlier, and a greater quantity and better quality, and improves the health o neighborhoods.

To manure or hime wet land, is to throw manure, lime and labor away. Shallow plowing operates to impoverish the soil. By stabling and housing stock through the winter, a saving of one-fourth less food may be off cted; that is, one-fourth less food will answer than when such stock are exposed to the inclemencies of the weather. A good dressing of plaster or clover, where the land is deficient in lime and sulphuric acid, will add one hundred per cent, to its produce. Periodical applications of ash s tend to keep up the integrity of soils, by supplying most, if not all, the inorganic substances. Thorough preparations of land is absolutely necessary to the successful and luxuriant growth of crops. Abundant crops cannot be grown for a succession of years, unless care be taken to provide an equivalent for the substances carried off the land in the products grown thereon.

To preserve meadows in their productiveness, it is better to harrow them every second autumn, apply top-dressing, and roll them. All stiff clays are benefited by fall and winter plowings; but should never be plowed while they are wet. If at such plowings, the furrow be materially deepened, lime, marl or ashes should be applied. Young stock should be moderately fed with grain in winter, and receive generous supplies of provender, it being essential to keep them in a fair condition, in order that the formation of muscles and bones may be encouraged and continuously carried on. Milch cows in winter, should be kept in dry, moderately warm, but well ventilated quarters, fed and watered three times a day, sulted twice a week, having clean beds, and in addition to their long provender should receive roots. Full complement of tools and implements of hus- ing rates: bandry are intimately connected with suc- ONE COPY.....

LIQUID-GRAFTING WAX .- Mr. L'Homme-Lefort luvented, not many years ago, a grafting composition which is very cheap, in a lottle with a tolerably wide mouth, at least six months unaltered. It is hid on in as thin a coat as possible by means of a flat piece of wood. Within a few days it will be as hard as a piece of stone. It is not affected by severe cold; it never softens or cracks when exposed to atmosphere action.

When applied to wounds in trees, it acts as an artificial cuticle. After a few days exposure to the atmosphere in a thin coat,

mean.

C.—Yes, that's the name of it.
C. or E.—Well, just down there, two doers east of Zahm's store, is the place, and my word for it you will be well pleased with your purchase if you invest in one of those machines. Messes, Bariany & Tare, the agents, have now on hand all styles and sizes of these halls meaning the machine. it assumes a whitish color, and becomes as hard as stone, being impervious to water and air. As long as the inventor kept the preparation secret, it was sold at very high prices. It is made after the following formula: Melt one pound of cuolmon resin over a gentle fire, add to it an ounce of beef tallow and stir it ell; take it from the fire, let it cool down a little, and then mix with it a tablespoonful of seven ounces of very strong alcohol, (ninety-five per cent.,) to be had at any druggist's store. The alcohol cools it down so rapidly that it will be necessary to put it again on the fire, stirrring it constantly. Still the utmost care must be exercised to prevent the alcohol from getting inflamed. To avoid it, the best way is to remove the vessel from the fire when the lump that may have been formed commences melting again. This must be continued till the whole is a homogeneous mass similar to

ABOUT Chapultepec, Mexico, is a grove of giant cypresses, said to be from one thousand five hundred to two thousand years old, with trunks scarred and torn by shot and shell fired in the many battles that have taken place in the immediate neighborhood. On the top of the rock is the old Spanish castle, built of porphyry, marble and sandstone. It contains a fine whole rock beneath it is honey-combed with passages, stables, cellars, dungeons, storerooms, and powder magazines, some of which were excavated by the Montezuscientific library and conservatory.
