Egg Artificially.

The annexed account of a wonderful discovery recently made in Germany is condensed from an article in a late number of a German paper, the Allgemeine Zeitung. The editor, in his introductory, remarks: "It is with no ordinary feel ng we sit down to make public the astonishing facts which foltow, well knowing, at first, we shall but excite the smiles of the incredn-lous; yet, as an independent journalist, we feel it our duty to lay before the public such matters of fact as may come within the scope of our own observation, and others may draw such servation, and others may draw such servation, and others may draw such conclusions from them as they may see

"Some years since," he continues, "the whole world was thrown into a fever of excitement by the announcement that Mr. Cross, an Englishman, had read before the Royal Electrical Society of London, a memoir in which he detailed a process by which he had succeeded in calling into life, by means of voltaic electricity, a minute insect of the acri species. The substance from which these insects were revived or created was the salicate of polassium, a perfect colorless or transparent liquid. Mr. Cross's experiment, were subsequently tried by Mr. Walker, Secretary to the Society, with entire success, and with every precaution asto the i stroduction of any foriegn substance that might contain the eggs of these insects. He was also equally successful when the experiment was conducted in an atmosphere of pure oxygen gas. These experiments have been certified to by the most respectable authority; and yet there are persons obstinate and

ignorant enough to deny the possibility of the production of life from the substance of flint. "As what we are about to mention is of a similar nature, we expect that the same class of persons will be incredulous as to the truth of our statement. But 'Truth is mighty and must prevail,' and we trust soon to give ocular demonstration of the facts detailed." We shall not follow the language of the paper, but give a brief outline of the facts recorded. It seems that for more than fourteen years Prof. Genifling, of Bruenbergh, a man well known to the literary and scientific world, has had his attention directed to the preduction of animal life by means of galvanism. This was a daring thought; but the professor, with the zeal and devotion worthy of the old alchemists in whose footsteps he was following.

persevered against obstacles that would your home ticker agents, apply to have discouraged any man less san-guine than himself and, at last, has had January 28, 1876, 19. the satisfaction of seeing his patient labors crowned with a success that will place his name in the foremost rank of that galaxy of bright stars who preceded him in the field of discovery. The professor's first experiment was to hatch chickens from the egg by the employment of artificial heat, after the manner of the Egyptians. In this he EBENSBURG. PA was entirely successful, and perfected a simple and compact apparatus to maintain by means of hot water an equal temperature for any period of time. This being accomplished, he turned his attention to the production of the egg; but, after innumerable experiments during a period of ten years, the details of which would fill a volume, he succeeded in making correct analysis of an egg. One step was acyet to be taken-the mysterious combination of the elements so as to form a compound similar to the natural article. Encouraged by his success the John DibertJohn D. Roberts. professor set about his almost hopeless task with a determination to surmount every obstacle. He felt satisfied that it was only by means of galvanism that BARES. his object could be accomplished; and he directed all his energies to the construction of a battery of constant. equal and moderate power. After JOHNSTOWN, Pa. trying nearly every kind of battery in use, he had almost begun to despair, when by accident he learned that a constant battery of moderate power had been constructed in England by placing a plate of zine and a plate of copper in an ordinary flower pot, and keeping the earth moistened with ammonia. He immediately constructed such an one. After various modifications he succeeded in adapting it to his purpose; and had the satisfac- A General Banking Business Transacted. tion, after Learly fourteen years of almost constant experiment, of seeing his labors crowned with success, and producing from cements a substance similar in all respects to an egg. Now came the exciting period of his labors, to see whether this artificially formed egg could be hatched by heat. He placed it in his hatching-oven, and watched it through a glass door almost constantly, searcely taking time to eat or sleep, until he saw the success of his grand experiment. Day after day he SHADED VELVET DRESSES. watched with patient assiduity the consummation of his darling scheme, and at last had the satisfaction of witnessing the consummation of his hopes. On the twentieth day after placing the egg in the oven a small hole was observed in one side of it, and shortly after the bill of a bird was thrust through. The professor was almost wild with delight, and several times was on the point of breaking the egg to see what kind of a bird he was going to have. He restrained himself, however, and next morning had the satisfaction of finding in the receiver a live BARK, HIDES, AND PLASTERERS' HAIR. bird of some unknown species, perfect in its anatomy, but, strange to say,

from which we quote, "has almost upset our previous notions of natural

A Savant Makes and Hatches an has set about another analysis, and has no doubt of being able to produce perfect birds of every known species. The Allgemeine Zeitung of the next day remarks that the whole city is electrified with the development.

WATER .- A most singular discovery was yesterday made in the Savage mine. This is the finding of living fish in the water now flooding both the Savage and Hale and Norcross mines. The fish found were five in number, and were yesterday afternoon hoisted up the incline in the large iron hoisting tank and dumped into the pump tank at the bottom of the vertical shaft. The fishes are eyeless, and are only about three or four inches in length

They are blood red in color. The temperature of the water in which they are found is 128 degrees

| Dealers in Distin & Co.'s (London), Besson (London), Saxe (Paris), Piston Valve, and our own mak
| Fahrenhelt—almost scalding hot.—
| Fahrenhelt scalding hot.— When the fish were taken out of the hot water in which they are found, and placed in a bucket of cold water, for the purpose of being brought to the surface, they died almost instantly. The cold water at once chilled their life

In appearance these subterranean members of the finny tribe somewhat resemble gold fish. They seem lively and sportive enough while in their native hot water, notwithstanding the fact that they have no eyes nor even the rudiments of eyes. The water by which the mines are flooded broke in at a depth of 3,200 feet in a drift that was being pushed to the northward in the Savage. It rose in the mine-also in the Hale and Norcross, the two mines being connected-to the height of 400 feet; that is, up to the 1,800 foot level. This would seem to prove that a subterfanean reservoir or lake has been tapped, and from this lake doubtless came the fish hoisted from the mine last evening.

Evcless fishes are frequently found in the lakes of large caves, but we have never before heard of their existence in either surface or subtereanean water the temperature of which was so high | Interchangeable Handle and Shield Combined. as is the water in these mines. The lower workings of the Savage mine are far below the bed of the Carson river, below the bottom of the Washoe lake -below any water running or standing anywhere within a distance of ten miles of the mine .- Territorial.

BURYING APPLES .- Some of our readers are familiar with the method of keeping apples by burying in heaps out-of-doors, and covering with straw Nos. 278, 280 and 282 Washington St., and then earth. A modification is described in a late French journal, which appears to be a great improvement. A spot of ground is selected under evergreen trees, and in a shel-W. D. M'CLELLANDJohn HANNAN. tered place. The fruit is placed in a conical heap and covered with dry comes up from the earth on which the fruit rests. The depth of leaves must be according to the severity of the climate, and to the amount of shelter afforded by the evergreen trees. With fair shelter, we think a foot of leaves would be ample protection in the Northern States. The French account says there must be twice the bulk of leaves as of fruit, but this is too indefinite, without stating the size of the map. In our forests, with a thin layer of leaves, the earth scarcely freezes, and many bali hardy green house plants might be wintered in dense woods. An equal protection is afforded by a heavy mass of evergreen At PRICES Below boughs and sheltered from winds. Fruit thus kept maintains a remarkable freshness. This mode is said to Wareroom, No. 81-FRANKLIN Street, have been suggested by seeing pears and apples accidentally covered by the leaves which fell on them under the trees .- Country Gentleman.

> A BIRD'S NEST .- There is a pretty nest in the musuem of Brown University, which shows what wisdom God can give to a little bird.

The nest was hung by strings, so the babies would be rocked to sleep by g every breeze. But as they grew heavier the mother bird found that her be, may cure himself cheaply, privately, and roditwig was too weak. So she looked about until she found a stout cord. This she wove around the nest, and then hung it up to a strong limb overerhead. This steadied it and made all

Some little swallows once built a nest against a lime kiln. But the wall was so warm that the clay soon cracked and the nest fell down. Immediately they built it over, but again it fell. Not discouraged, they tried it a third time with no better success.

They built a fourth nest, which rewith the same clay. This they did also the third year. After that they did not return, having probably lived out the term of swallow life.

A SHOWER OF FISHES -In 1833, at Lake Gwynant, in the county of Caernarvon, a woman was engaged washing a pail at the edge of the lake, and a number of children were with her. While she was thus employed, at 8 P. M, a shower of small fish fell partly into the lake, and partly upon the land, close to where the woman was. The fish resembled herring, but were much smaller. A heavy shower of rain had preceded the descent of these, and the day following there was much rain and thunder.

To Cure Hoarseness.—When the voice is lost, as is sometimes the case from the effects of a cold, a simple, pleasant remedy is furnished by beatup the white of an egg, adding to it the juice of a lemon, and sweetening with white sugger to the taste. Taken with white sugar to the taste. Take a
